system stack overflow.

> I use the last pointer (*next) in the first NDB-structure to get the
> address to the next NDB. Is this correct?

Naaaaaah ! ;-)

The entry 'next' is only for internal use of STinG. Didn't I have CNget_NDB()
explizitly write a NULL into that entry before passing it to the application ?
If not, then I should do it. You, as an application programmer, should ignore

it. The next NDB is fetched just like the first one, with CNget_NDB().

> the pseudo code for the NDB-processing is like this:
>
> 1. call CNget_NDB with the handle
> 2. was the returned pointer in d0=0? if yes: quit.

> 3. use the pointer to get the address to the data of the NDB

> (*ndata), and how many bytes to read (len).

Ok.

> 4. use a small loop to copy the data from the NDB to a buffer,

> null-terminate the string, and print it.

You know this is the sort of action CNget_NDB is intended to avoid, for speed reasons. What you do here is exactly what does CNget_block() internally. Sure it's ok for testing, but for efficiency you should do the processing 'in place' i.e. without copying to a buffer; otherwise the use of CNget_NDB() is pointless.

> 5. check the last pointer (*next) to see if there is another NDB
to
> process. If zero, goto 7.

Do not do this. Simply omit this step. There is never 'another NDB' as linked to this NDB via the 'next' entry.

> 6. KRfree both the data pointed to by the NDB (*ndata) and the
NDB
> itself. Goto 3.

This must be done regardless of the 'next' entry. Replace the "Goto 3" by "Goto 1"

> Is it correct that the address to the block
> that I want to free using KRfree, should be passed on the stack?

Yes. All parameter passing is done one the stack, so that STinG can be programmed with most languages (very few allow control over which CPU registers are used for which purpose).

Cheers Peter

No Visual * stuff ! Visual * is Microsoft, what do you expect ?

There is about a dozen different C compilers, ranging from poor (old ones)
to very nice. There is GNU C++. There are several BASICs, and compilers
for two or three dozen other programming languages.

Cheers Peter

Strange idea. That will cost a lot of memory to handle 1000 GEM

objects.

A better method is to create only 10 or 15 object for the pop-up, and
you modify them dynamicaly before displaying to screen.
That means writing your own pop-up function, with important variables
such as the start number, an internal table...

Wana have mine in GFA Basic?
(the Joe's calling module pop-up is a good exemple)

Au revoir

Kaffe (a JVM with 68k JIT) is ported to TOS/MiNT, but you'll need
atleast a TT with 16Mb (atleast) to use it. And there's no AWT, so
it's not very useful (yet).

I don't know if it's released yet, but if anybody is interested then
mail me and I can ask the author.

I don't know if a JDK is available, but I would guess that Sun's javac
is ported (isn't the source available?).

Rather a lot!

>LCGSNB.LIB
>LCMSNB.LIB
>LCSNB.LIB

>   If no one has a solution to this, does anyone out there use makefiles
>with Lattice?

I dunno how capable the Lattice make is but with MWC I split up
sources into subdirectories grouped by "subject". Something like this
will serve as an example:

```
SRCLIB--+
        |
        +--G--+
        |     |
        |     +--GEM--+
        |     |       |
        |     |       +--AES--+
        |     |       |       |
        |     |       |       +--FORM
        |     |       |       |
        |     |       |       +--SHEL
        |     |       |       |
        |     |       |      etc
        |     |       |
        |     |       +--VDI
        |     |       |
        |     |       +--MISC
        |     |
        |     +--TOS--etc
        |
        +--U--+
              |
              +--STR
              |
              +--MEM
              |
             etc
```

I used to simply 'cd' to SRCLIB then 'make'. The SRCLIB makefile just
invokes make for G and U. The G makefile invokes make for GEM and TOS
and so down through the subdirectories.

Unfortunately my machine only had 1 meg at the time and there came a
point where this took too much ram. So I resorted to a batchfile which
specificially invokes each make in turn. I've never bothered to change
it back since I got more ram.

>Specifically, I need a makefile that will recursively

>do makes.
>
>I can do it with gcc/make, but I'm not quite sure about lc.ttp
>and clink.ttp with make.

I dunno the capabilites of the lattice linker but with MWC if you put
a load of stuff into an object file then reference something in it,
all the other stuff in the object file gets pulled in as well.

The following is the makefile for my CPU folder ...

```
CFLAGS   =-A

NAM  =_cp_cpu
OBJ  =_cp_peek.o _cp_poke.o _cp_sup.o _cp_usr.o _cp_stk.o
     _cp_stat.o\
     _cp_irq.o _cp_86l.o _cp_86w.o _cp_odda.o _cp_rda6.o
     _cp_boot.o\
     _cp_cook.o _cp_osh.o

HDR  =cpu.h

$(NAM).obj:   $(OBJ)
         rm -v \inc\$(HDR)
         cp -v $(HDR) \inc
         ar rs \lib\libu.a $(OBJ)
         ld -r -o .\$(NAM).obj $(OBJ)
         autodoc $(OBJ)

$(OBJ):       $(HDR)
```

It builds the sources, updates the header file, then has the librarian
(archiver 'ar' here) put the object file for each source into libu.a
thus the MWC linker only pulls in the code referenced, not all the
other files in CPU as well! The linker 'ld' then gets invoked. It
gathers all the individual object files into a single object file thus
the dependancy is satisfied.

autodoc can be ignored. For the curious it extracts documentation from
the sources and builds a documentation file.

kbhit? Which compiler is this?

If we're talking about the PC then kbhit() is part of conio.h which
are low level calls whereas stdio.h is high level and very likely
buffered.

If we're talking Atari then I suspect the same. kbhit will probably be
a gemdos or more likely a bios (Bconstat) call and this will not mix
well with stdio either for the same reason.

Btw, I once had a dumb terminal off a mainframe for a few days. I
could get my STFM to send stuff to it which would be displayed fine
but could not get input back from the terminal's keyboard. Bear in
mind I had no info at all on the terminal (and I hadn't had the Atari
long) so anything could have been the cause but for what it's worth,
the STFM did not have HsModem at all.

Usually the path is the same as the program.

Thus:

If you run ...

c:\fred\prog.exe

... then the path is

c:\fred\

ie Dgetdrv(),Dgetpath().

but this is not always true. Multitasking systems allow the user to
change this, and even old Gem versions would not set the path properly
if the user right-clicked on the program (the path would remain set to
the active window).

Gem programs can find out which path they were launched from by
calling shel_read().

Tos programs have to rely on Dgetdrv(),Dgetpath().

Also, programs sometimes use environmental variables like $HOME for
example (to override the above).

Lattice C 5.6

>If we're talking about the PC then kbhit() is part of conio.h which

Hmm ... I changed buffering with setvbuf() but no setting helps.

Is there any better solution to this, I realize kbhit() might not be the
best. I beleive if I read with getc it will wait for input instead of giving

me EOF of a stream. How do I do?

Nevermind. I now know that there's only one block of data and
CNbyte_count() tells me how big this block is.

I saw that there's a function called CNget_block(), which probably
copies the data received to a buffer which the programmer specifies. It
takes the handle of the TCP-connection, the adress to which you want the
data copied, and how big the buffer is. So it has to work the way I
think, right? Now I've managed to open a TCP-connection, send some data,
and use CNbyte_count() to know how much is available to read. But since
I only have one falcon (or one atari-computer for that matter) I've been
unable to test anything seriously. I tried to connect to my own
IP-address and to send data to it, but I didn't get any data back. Maybe
STiNG doesn't transfer data if the sender has the same IP-address as the
receiver. TCP_send didn't give me an error message though, so it should
have worked.

But for now I don't have any more questions, since I haven't been able

to test transferring data. I only hope that it'll work when I've got
another atari.

Hi!

Guy Harrison <guy@swampdog.demon.co.uk> wrote:
> Gem programs can find out which path they were launched from by
> calling shel_read().

But that also isn't always true. For example, the system shell in
MultiTOS does not get its path this way.

Therefore, I use a different method if shel_read() isn't successful:
shel_find(). It's documented that shel_find() first searches the
program's home directory, even if the current dir is set differently.
So, search for your application's filename and parse the path returned
(because it's often a relative path).

Btw, if you just want to load some support files, you even don't need to
know about the application's path, just use shel_find(). rsrc_load()
internally also uses shel_find().

> Tos programs have to rely on Dgetdrv(),Dgetpath().

No, they should rather check argv[0], if it was set by the shell. But
it's not guaranteed that argv[0] contains a path, and as a TOS program
may have been run from a completely different directory, it's actually
impossible to get the program's path in call circumstances.

You can only be sure about it if argv[0] is set _and_ contains an
absolute path.

Ciao

Thomas

>>are low level calls whereas stdio.h is high level and very likely
>>buffered.
>
>
>Hmm ... I changed buffering with setvbuf() but no setting helps.

Imo, if ever I have a situation where I need to turn buffering off then I'm inclined to leave it as it is and approach it the problem at a lower level. After all, the main reason for disabling buffering is usually to "see" the behaviour of the operating system. This is machine dependent so the code might as well use the operating system i/o calls in the first place. Doing this also has the benefit it bypasses any inconsistencies that might exist in the compiler's stdio implementation. Who knows what os calls stdio performs - just because buffering is disabled does not mean that it couldn't be making os calls that use their own buffering!

Lastly, there have been reports of Lattice having a 'bug' in its "filing system" (possibly the reason some folks find Newsie does wierd stuff to files). No-one has ever stated specifically what this bug is. It would bother me if I used Lattice!

>>If we're talking Atari then I suspect the same. kbhit will probably be
>>a gemdos or more likely a bios (Bconstat) call and this will not mix

>I beleive if I read with getc it will wait for input instead of giving
>me EOF of a stream.

Yes, it will wait for input. It can also return EOF! ;-)

>How do I do?

I'd code for Bconin/Bconout directly and locate the problem. Something like this at both ends ...

[I made this up just now btw] :-)

```
Test()
{char    *op  ="Hello?";
 int16   ch;

 /* loop until "Hello?" sent */
 for (;*op;)  {
     /* ?char waiting? */
     if (Bconstat(BC_AUX))  {/* yes*/
          /* fetch and dump on screen */
          ch = Bconin(BC_AUX);
          Bconout(BC_CON,ch);
```

```
     }
     /* try and send another char then ... */

     /* ?we done sending? */
     if (*op) {/* no */
          /* pause until stream ready */
          while (!Bcostat(BC_AUX))    ;
          /* send next char */
          Bconout(BC_AUX,(int16)*op);
          op++;
     }
 }
}
```

In *theory* running the above on both machines should allow each end to receive chars and transmit them at the same time. If it doesn't work then:

a)
My code is faulty.

b)
The problem lies in the operating system. Is the serial port configured properly and is there anything about 'Bcon' that we don't know - Bconmap springs to mind for instance.

If you are successful please let me know. By strange co-incidence I may need to be doing exactly the same thing myself between a PC and an STE. I've finally managed to dump the PC's internal modem and now have the com ports working again. All I need now is some space to set up the Atari - Yippee! <g>

Methinks you'll have to mess with the STiNG settings/routing. The term
"loopback adaptor" comes to mind. This is address 127.0.0.1 iirc and
may be part of what needs sorting to have data sent reappear back
where it started ... but I really am talking about stuff I know
nothing about!

Of course it's "IN MY OPINION", you already said that you disagree (as
usually when the two of us talk here :-D), so how could I assume
universality of my statement ? ;-)

>>filesystems are used, a RESET can leave a bad mess on the harddisk that

The big majority of the people using their Atari have a hard drive.
But that's not the point. Caching file systems can be used with floppies
too, if used, they leave the floppy corrupted upon RESET.

It's also not restricted to file systems. Most more sophisticated systems
require some shutdown action in order to gracefully switch off. A RESET
is not an option on such machines.

This is irrelevant if the RESET is triggered by a game that takes the entire
machine anyway, kicking out everything else. I know that you're only concerned
with such stuff.

>>is, if things go bad, not recoverable. I would never, ever let any exe-

>
> Hello ?????... wakey wakey Peter ?...if you tampered with a file and
> it reset your luverly hd. would you tamper with it again?... DOH!

The virus, which you cited here, - unless it wasn't a dumbhead who did it - will of course install itself in one of the two regions in memory that TOS will automatically restart. This means, a RESET is useless, the virus will be restarted and succeed to tamper with your files, corrupt your system.

If you didn't know that this is possible with TOS, then it's time that YOU wake up, Tony. After all, the possibility is known since 1986 or so.

Again, this is heavily besides the point. If you find a virus, you're free to hit the RESET button. The subject of this thread deals with programmed RESET. How should that help fighting "programs tampering with files" ? Any idea ?

Cheers Peter

Looks like an interesting concept. I think you got the main basics from other postings here. This is what I'd say.

For both, warm and cold, raise the CPU interrupt flags to 7. Move the system stack to a save area (for the following paragraph).

For a cold boot, do the following now : Clear the reset system variables as suggested in parallel postings. Clear the two memory pages that makes programs survive RESET. For safety, I'd erase the entire system variables area. Execute an assembler "RESET" statement to reset hardware (not all TOS versions do that on their own IIRC).

Now for both again, jump across the vector to be found in address 4 (The first eight bytes of the address space are copies of the first bytes of ROM). This is the address too that the CPU reads into the program counter upon RESET. That's all.

You won't have any chance to do a good reset "function" in C. You cannot raise CPU interrupt flags, nor execute "RESET" from C, so you must use assembly language for this.

Cheers Peter

> the 'expense' of TCP?

I'm not sure what you mean here. UDP and TCP are treated exactly indentically
by the network layer (IP), so delays that a packet of one type experiences
would be the same as if the packet were the other type.

> ie I read some news article somewhere, where someone was moaning that
> UDP was slowing down TCP. This could have been a load of nonsense,

I think it is. There is no interaction between UDP and TCP, apart from
each one taking bandwidth for delivering the packet which naturally is
not usable for the other protocol.

It could be meant on an implementation level though. TCP is pretty
sophisticated in that it achieves it's goals with little network traffic.
If a reliable data stream concept (i.e. avoid dupes and loss etc.) were
to be build with UDP, it's easy to waste bandwidth doing it in a less
than optimal way. This bandwidth again is not available for TCP, possibly
that was meant by that publication.

That's one way. There is a more flexible way, both are described in detail
in the programming docs. Read the pages on TCP_open in STING.HYP (needs
ST-Guide to view it).

> the slave or the master exits.

Generally, the best solution for the master is keeping always one socket in
LISTEN state, i.e. waiting for a slave to connect to it.

This means TCP_open'ing it, and continually observing it whether it becomes
connected. When it becomes, it is added to some server internal list of
open connections to deal with, and another TCP_open is done to have a new
socket LISTENing.

>: Is there some definition of which sockets i can use for my game? I saw

The latter is certainly a good idea, regarding the master TCP port number.

On the slave's side the master's port number must be specified, so a good
default value which can be edited is a good idea.

If the more flexible TCP_open is used, the local port number must be specified
too. Observe the TCP_open return code, it will tell if any conflicts arise !
Needless to say, this should be done in any case.

You're rather free to choose the port number, just the numbers from 0 to 1023
must be avoided. They are the so-called well-known ports which have a meaning
assigned to them. Port 80 for instance is reserved for WWW, Mario posted some
more :

> Some port numbers, especially the lower ones, are already reserved for

>: how many bytes to read in this 'block'? If the later is true, would I
>: then have to call CNbyte_count several times until it tells me that
>: there are no more blocks for me to read?

There is no way even the sending side TCP can know how many data the application will pass to it for delivering to the remote. So how can the remote know how many data is about to come ? ;-)

CNbyte_count returns the number of bytes that can be read from TCP *immediately* without having any further data arrive from the network. Obviously this is data that already *has* arrived, and is stored locally. It is limited by the receive window, so if you have a receive window of, say, 8192 bytes, CNbyte_count will never return a number larger than that one.

Not sure what you mean here. CNbyte_count does not deliver data. You'll need to do another call to actually read it (by the application). You can read single bytes by CNget_char, or big blocks by CNget_block or CNget_NDB. Read the docs in STING.HYP

Yep, using the same machine is faster than even Ethernet, no way to introduce trouble configuring a real network, and you do not need to change seats all the time to move to the other machine. Will need multitasking (MagiC or MiNT) though, whereas single-TOS is enough for a two machines test setup.

Cheers Peter

You haven't read the programming docs. CNget_NDB is a very efficient way to receive data, it must be handled with a little care though. The latter means that, after it has been called, and returned data (not a NULL) indicated by a real pointer (to a NDB), it cannot simply be left alone. After the data has been processed, the application is responsible for properly releasing the NDB, if it doesn't do that, STinG will run out of internal memory eventually. See STING.HYP for example code how to do that (it's easy, but must not be forgotten).

>>> CNbyte_count() returns negative if there's an error, the number of

Exactly. It's the reason why MGftp is so exorbitantly slow reading directory
contents. It does so using CNget_char ...

> think, right?

Right. Note this function has a quirk that is actually a relic from STiK,

which I cannot change without breaking STiK compatibility. It won't copy
any data (return an error) if the block is specified to be bigger that
the amount of data arriving. For instance assume CNbyte_count has returned
1011 bytes are ready to be read. Calling

```
   CNget_block (handle, buffer_ptr, 1024);
```

will lead to an error (no data copied) since the buffer is 1024 bytes large
but there are only 1011 bytes to be copied. It's safe to do the following
though :

```
   number = CNbyte_count (handle);
   error = CNget_block (handle, buffer_ptr, (number > 1024) ? 1024 : number);
   if (error < 0) {
        /* error handling */
      }
```

> Now I've managed to open a TCP-connection, send some data,
> and use CNbyte_count() to know how much is available to read. But since

Dear Madam, Dear Sir,

After technical problems, we are pleasured to announce you the OFFICIAL
OPENING of our NEW WEB SITE.

www.centek.fr

If you have already visited our site, we propose you to come again.

Except the technical problems we have corrected (NETSCAPE is now running !),
some new informations about the CENTurbo II are available:
- new benchs of the CT2 versus the TT030 and the ST wich will allow you to
  realize the difference between the CT2 and your computer or the new
machines...
- hardware informations for the hardware and software designers and the others,
  especially a very simple 'block diagram' to understand what the extraordinary

power the CT2 brings to the Falcon !

News PHENIX informations will nextly be available, but we want to confirm you that the number of PCI slots is THREE, not TWO ! The new file 1.3 corrects this error.

Don't forget to have a look on the 'NEWS' about the DSP 56301 card and the new management of the IDE HDD by the CT2...and on the new software 'V-TRAX'.

ATTENTION
Caused by an external technical problem, our e-mail centek@graphity.fr stopped to run correctly the 10th July.
If you have wrote us after this date, please send us again your mail at vxp@imaginet.fr
We will answer you as soon as possible...

Yours Sincerely

--

CNget_NDB is about the best call available if you are writting your own communications spec.

An NDB is a Network Descriptor Block.

CNget_NDB get's the next one on the queue for the connection.

What is a Network Descriptor Block you ask?

Basically a TCPIP packet with all the low level headers ripped off.

So you can format your own packet, with your own headers. And this call will grab the packet and strip it back down to the same state it was sent in.

Completely halfassed made up example to illustrate the idea.

You want to send a message via a server to another player on the server. So we'll have this great fictitious header setup.

```
0x80 (Send a message for me)
joe blobb (recipient)
I'm going to kill you sucka (the message, maybe topped off with a
                    dual use of \r\n)
```

When the server get's this NDB they will see it the same way
So they can just parse the lines and act on them.

It really does save alot of overhead and trafic on the network if done properly.

Hope this helped.

Dan

Hi!

Peter Rottengatter <perot@arisia.stud.uni-hannover.de> wrote:
> Clear the two memory pages that makes programs
> survive RESET.

If you're referring to $600 - $800, I wouldn't advise that. Falcons and
TTs store their PMMU tree at $700, so overwriting it will cause a nice
crash.

Also note that one machines with PMMU, you can't actually be sure a cold
boot will be one. For example, a virus could have installed a PMMU tree
which moves away logical $0 to some other physical memory adress, so
that neither overwriting all system variables including memvalids, nor
reading the reset vector from $0 will do the right thing.

Of course, you could also try to switch off the PMMU on affected
processors before performing the reset, but AFAIR this will also cause a
crash - at least on the Falcon - even with interrupts turned off.

So, a really safe cold boot will only be physically switching power off
for at least 10 seconds, then turn it back on.

Ciao

Thomas

Make sure you disable interrupts around the access to the sound chip.
Otherwise the floppy VBL interrupt might interfere, which wants to access
the sound chip as well.

> Have you activated STinG (STING.CPX, "STinG Internals") ?

Yes, I did that, and also set the IP before activating. My program does
this:

1. Locate 'STiK' cookie
2. Get the address to DRV_LIST
3. Check the magic string
4. Call get_dftab with a pointer to a string 'TRANSPORT_TCPIP'
5. Use the pointer returned from get_dftab to call TCP_open, with
IP=64.64.64.64 (just an example) and port=13014 and outputbuffer=100 (at
least I think obuffer stands for outputbuffer). TCP_open returns a
positive value, which I take as the handle.

6. Call TCP_send with the handle, pointer to the string I want to send, and how many bytes to send. TCP_send returns positive (or NULL, I can't remember which)
7. Call CNbyte_count with the handle, but it returns NULL, so somehow the transfer didn't work out.
8. Call CNget_block (quite pointless, since CNbyte_count didn't work, but anyway), and then print the received string to the screen. Since (7.) didn't work no string appears on the screen either.

Maybe there's something in the setup of STiNG that I've missed. Do I have to do something else besides setting IP to 64.64.64.64 and activating? I use the same .TAB file that I use for all other TCP/IP stuff, using HSMODEM 7 and all that, and it works fine.
I tried to do (5.) with STiNG inactive, and it returned an error message, so I can't have messed that up, can I?
Note that (7.) returns NULL, not an error, so doesn't that mean that the actual transfer didn't take place? (and not that the STiK-compatibility 'bug' triggered, since it would have been an error then).
I think I'll try things a bit more now, I 'll report how it all went tomorrow.

Regards
Henrik

btw. I just came to think of something. Maybe my program is too quick att checking if there's some data to read after having sent some. I think I'll wait a second and then try.

No. There is nothing emulated (if it's not a Power Mac at least). These
Macs run Atari software natively, and MagiC is just an application for
MacOS, and the OS for the Atari software. No emulation, but I admit the
classical "clone" term is not very well suited either - still better
than "emulator".

MagiC-PC is a true emulator.

Cheers Peter

Hello

You can find the last version of GCC (2.8.1) at:
ftp://ftp.rz.tu-harburg.de/pub/software/systems/atari/gnu/gcc/

It's compiled by Christian Felsh
and it work very well.

bye

G'day

Thankyou for the welcome! The reason I don't use the ST much nowdays is that I need to use Java and Ada for my course at Uni, so I had to cross over to the dark side (Mac).

Thinking about it though, there is no free or convenient Ada compiler for the Mac. Now, the Ada compiler we use on the PC-contemptibles at Uni run GNAT Ada95 - the GNu Ada Translator. Could this be a case for a gcc-compatible compiler on the ST? Does such a beastie exist?

If it did this could strike a blow against the PC-owning blockheads who thinks that they invented computers! Can anyone suggest a site that would have a gcc for the ST?

I have to admit at this point that I'm not one-eyed - I also have a softish spot for the Mac. Less soft nowdays though, after Microsoft sticking their fingers into the pie...

Cheers

It certainly is the most efficient way. But I'd recommend it only after
the programmer understood completely what the call does.

It does save a lot of internal overhead on the receiving side, but compared
to CNget_block it does not save any traffic overhead. CNget_block is a more
generic way of receiving data, at the expense of slightly more CPU overhead.

Cheers Peter

Setting the IP alone is not enough, the corresponding port must be active, otherwise STinG ignores that IP address. I noticed from what you wrote further on that you did this, but you'd also need to have some connection there, and a corresponding route. Better use loopback.

> the transfer didn't work out.

Of course it doesn't as there was no machine with the address 64.64.64.64. But if CNbyte_count returns zero, it merely means no data has been received yet. It's not an error condition. TCP_open cannot return positive values, it probably was zero.

For connecting to clients or servers on the same machine, you must specify a local IP address, or a loopback address. Loopback addresses are those of the form 127.x.y.z

So do the following :

Have one program (server) do a passive (!) TCP_open by doing

```
   TCP_open (0, 13014);
```

Start this program. It will listen on port 13014, waiting for connections.

Now do in another program (client)

```
   TCP_open (0x7f000001ul, 13014);
```

and start it parallel to the first one. Note 0x7f000001ul == 127.0.0.1.
The second causes TCP to actively open a connection to the "owner" of the port 13014, which is the first program (the server). If the server monitors the connection state while waiting, it will notice that the state changes from TLISTEN to TESTABLISH at the precise moment the client did the TCP_open.

Now the two programs can exchange data using the TCP_send and the CN* calls in a symmetrical network situation. You can have the two programs run on different machines by using the server machine's IP address in the client's TCP_open.

> Maybe there's something in the setup of STiNG that I've missed. Do I
> have to do something else besides setting IP to 64.64.64.64 and
> activating? I use the same .TAB file that I use for all other TCP/IP

ROUTE.TAB must have a line saying

```
0.0.0.0       0.0.0.0       <name of port you activated>
     0.0.0.0
```

> Note that (7.) returns NULL, not an error, so doesn't that mean that the
> actual transfer didn't take place?

TCP_open does not cause any transfer in the sense to be reported by CNbyte_count. CNbyte_count only reports user bytes.

> (and not that the STiK-compatibility
> 'bug' triggered, since it would have been an error then).

What the hell is that ???

> btw. I just came to think of something. Maybe my program is too quick
> att checking if there's some data to read after having sent some. I
> think I'll wait a second and then try.

That's possible. There will be a few milliseconds before the data appears to get received.

Cheers Peter

>

Here's a small devpac source I use.

```
YmRegs=$FFFF8800
YmDataIn=$FFFF8800
YnDataOut=$FFFF8802

write_prn: macro
        move.b    #15,YmRegs.w
        move.b   \1,YmDataOut.w
   endm

read_prn: macro
        move.b    #15,YmRegs.w
        move.b   YmDataIn.w,\1
   endm

usage:
       write_prn    #123

       read_prn     d1
```

 If there's still problems, your cable is perhaps too long / not shield (is the error always on the same bit ?). So you'll have to send your datas in packets with a checksum and the reciever acknowledge each packet after testing it.

hope this helps

salut
Eric

You need to raise the CPU ipl.

Bonjour tous,

Une petite info pour vous annoncer que nous reprennons la production
d'une holorge externe pour Falcon. La NEWCLOCK (original non ?) est donc
une
horloge externe compatible B-CLOCK d livrant donc 2 fr quences : 44,1
Khz et
48 khz programmable par soft. Le boitier de taille 44x40x16 se connecte
 la
sortie DSP et poss de une LED indiquant dans quelle fr quence se trouve
l'horloge.

Le prix est toujours le m me : 340 F !

Voila pour cette news !

That's because the VBL isn't accessible via XBIOS(). What you'd need is something like this:

```
read_byte       link    a6,#-4
        clr.l   -(sp)
        move    #$20,-(sp)
        trap    #1              ; go into supervisor mode
        addq.l  #6,sp
        move.l  d0,-(sp)        ; store old supervisor stack for restoration
        move    sr,-4(a6)       ; store status register for restoration
        or      #$700,sr        ; disable all interupts
        move.b  #15,$ffff8800.w ; NB the $xx.w may not work with 32 bit
        move.b  $ffff8800.w,d0  ; memory addressing.
        move    d0,-2(a6)       ; store value
        move    -4(a6),sr       ; restore status register
        move    #$20,-(sp)
        trap    #1              ; back to user mode
```

```
        addq.l  #6,sp
        move    -2(a6),d0
        unlk    a6
        rts
```

What this does it to go into supervisor mode and disables all the interupts, reads the input, enables the interupts and then goes back to user mode. This prevents the values being modified in between selecting the register and getting the input. This will make it quite a bit slower, because of swapping between suvervisor and user modes, so if you know how much you're wanting to read beforehand, it would be better to use something like:

```
read_bytes       link    a6,#-4
        clr.l   -(sp)
        move    #$20,-(sp)
        trap    #1
        addq.l  #6,sp
        move.l  d0,-(sp)
        move    sr,-4(a6)
        or      #$700,sr
        move    8(a6),d1        ; number of bytes to read
        subq    #1,d0
        move    10(a6),a0       ; buffer to store them
.loop
        move.b  #15,$ffff8800.w
        move.b  $ffff8800.w,(a0)+
;
; at this point you'll want to add some form of delay.
;
        dbra    d0,.loop        ; jump back to .loop until d0=-1
        move    d0,-2(a6)
        move    -4(a6),sr
        move    #$20,-(sp)
        trap    #1              ; back to user mode
        addq.l  #6,sp
        move    -2(a6),d0
        unlk    a6
        rts
```

call this routine with:

```
        move.l  #buffer,-(sp)   ; buffer to store the bytes.
        move    #count,-(sp)    ; number of bytes to read
        jsr     read_bytes      ; or bsr read_bytes
        addq.l  #6,sp           ; correct stack
```

The reason for adding a delay is to give time for data to be read from the parallel port and put into the YM-2149 register for you to read.

Regards,
     David.

Oh no ! Use

```
     move.w  sr, d0
     or.w    #$0700, sr
```

to disable interrupts prior to accessing the sound chip, then

```
     move.w  d0, sr
```

afterwards.

Cheers Peter

Have been digging through my old ST stuff in hopes
of possibly using it for some special projects and
came across my copies (legal) of Megamax Laser
C and Debugger.

What ever happened to this company?

Were there any updates?

Does anyone still use these tools?

Thanks,
Mike (n4cnw <at> mindspring <dot> com)

  You send/receive with 2 computers (perhaps Atari) or with an
external hardware ?

> move.b #15,($FF8800)
> move.b ($FF8800),D0

  This is not enough to read data! You must use a minimum of
handshaking (with ack and strobe). By the way you can write
move.b #15,$ffff8800.w : it's faster and byteless.

> It works, but, sometimes (about once out 2000) the returned value
>is wrong, and I really don't understand why.

  You don't to search to the interrupt: they can destroy data but
you must select and write in Yamaha register in IPL 7 !!!

Sacha Hnatiuk (I write the bios functions for Dolmen, so...)

Yes I've done almost exactly what you propose. I have made one program
that opens a passive connection as you say, and then it waits for the
remote host IP in the CAB structure to change to something other than
NULL. It checks this every 25ms. When it detects an IP, the program
prints it as 48.0.0.140. The state you're talking about, is it the last
word to be found in the CIB structure? Maybe it's better to check the
state than the remote IP.

Then I start the 'active' program, that opens a connection to 127.0.0.1
and sends a small string. When the connection is established, the
passive program reacts, but it never gets any data, even though the
active program reports success when sending.

Yes I have it that way.

> > (and not that the STiK-compatibility
> > 'bug' triggered, since it would have been an error then).
>
> What the hell is that ???

Nevermind. But shouldn't the transfer be quite quick, since it's done on
the same machine?

Regards
Henrik

Gee, it would help wouldn't if the site was actually in *English*. Not that
I'm discouraging people from keeping the old systems alive just because they
don't do it in English, but it seem a bit inappropriate to be posting the URL
of a non-english website to a predominately english speaking newsgroup, since
most of us won't be able to understand it. ;-)

Neither am I! Nevertheless you've figured out what I was trying to ask
anyway. ;-)

That would make sense, yes. Ta.

No, that is done by STiNG.

>Isn't resolving actually for
>translating 'human' addresses (like www.anyhost.com) into IP-addresses
>using a DNS-server?

Yes, that's it exactly. Btw, addresses like 123.456.789.012 are known
as "dotted quads".

I believe you can send either type to the 'resolve' function. You
don't need a DNS server if you pass a dotted quad: obviously - there's
nothing to look up!

If you pass a normal human address, then the resolver will ask the DNS
server for the name's dotted quad. The DNS server address is in one of
the config files. Just look for NAMESERVER and put in the dotted quad
for the DNS server you want to use.

>My game would have to be able to quickly send data
>without confirming any connection otherwise the whole came would stop
>while connection is being established.

Before your game starts, you'll have used STiNG's dialler to connect
to your ISP. STiNG will then start talking to your ISP. It won't be
saying much - enough to prevent the ISP software hanging up the phone.

On the other hand, if you had your game running on two machines which
were connected directly together then there's be no dialling. You'd
just enable STiNG on both machines end they'd talk to each other -
enough to prevent the other one 'hanging up'.

Now you'd have the actual game start. It would open a connection to
the other machine(s) and they'd start talking.

>Well, I read in the docs something about the transfer of IP-packets

>you may choose which of the protocols to use. I didn't see anything
>about there being a handler to handle TCP packets, but I may have missed
>that.

STiNG does it. The approach is similar to using files. TCP_open is rather like Fcreate/Fopen, TCP_send is like Fwrite. There's other stuff of course but essentially you have a handle, a buffer and the buffer size. You stuff data into TCP_write and STiNG sends it. Meanwhile anything STiNG receives gets bundled together internally waiting for you to read it.

The design of TCP allows its data packets to find their own way around. Certain packets might decide to take one route, other packets could take another. There is no way to tell. This means they can arrive in the wrong order. Some may arrive corrupted. Others may not arrive at all. The corrupted and missing packets require a request be sent to resend them. By the time your code gets data from STiNG all these low level problems have been dealt with you'll no doubt be glad to hear!

I don't know anything about ICMP I'm afraid. I think UDP is a lower level protocol than TCP but I can't remember any details.

>Does the STiNG-cookie contain a pointer to this tpl-structure?

Yes, but indirectly. Amazingly I've located some code from ages ago. Oh no you're probably thinking, "not more C" but further down - I've had MWC output commented assembly. Like I said, the syntax is strange but you'll no doubt find it easy to work out. ;-)

```
#include <stdio.h>
#include <osbind.h>
#include <stik.h>

DRV_LIST *drivers =NULL;
TPL      *tpl     =NULL;

typedef struct {
    long cktag;
    long ckvalue;
} ck_entry;

/*
Search cookie jar for stik cookie, save pointer in DRV_LIST above.
*/
static long
init_drivers()
{
     long i = 0;
     ck_entry *jar = *((ck_entry **) 0x5a0);

     while (jar[i].cktag) {
/* CJTAG = "STiK" (without quotes) */
          if (!strncmp((char *)&jar[i].cktag, CJTAG, 4)) {
               drivers = (DRV_LIST *)jar[i].ckvalue;
               return (0);
          }
          ++i;
     }
     return (0);   /* Pointless return value...     */
}

/*
Set things up so our program can talk to stik. The init_drivers
code must run in supervisor mode (obviously).
*/
bool
stik_init()
{
 Supexec(init_drivers);

 /* See if we got a value   */
 /* ?did init_drivers set non zero in DRV_LIST?
 if (drivers == (DRV_LIST *)NULL) {
     fprintf(stderr,"stik_init() - init_drivers() failed\n");
     return (false);
 }

 /* Check Magic number */
 /* MAGIC = "STiKmagic" (without quotes) */
 if (strcmp(MAGIC, drivers->magic)) {
     fprintf(stderr,"stik_init() - Magic string doesn't match\n");
```

```
    return (false);
 }

 tpl = (TPL *)get_dftab(TRANSPORT_DRIVER);
 if (tpl == (TPL *)NULL) {
    fprintf(stderr,"stik_init() - TPL load failure\n");
    return (false);
 }

 fprintf(stdout,"TPL up, Author %s, ver
%s\n",tpl->author,tpl->version);

 return (true);
}

Is the above in any way helpful?

>If so

>then i've understood how to call for example tcp_open. But I would still
>need to know the essentials like if STiNG requieres a VBL-interrupt and
>AES.

The dialler/config is a Gem program and there are a couple of CPX's so
in that respect the AES is needed. However, most of the information
they work with exist in simple text files which you can set manually.
That just leaves the dialler. Maybe you could dial then run your game?

As for interrupts, I'm really not too sure. I'll stick my neck out
here and say that it is interrupt driven but I don't know any more
than that. Perhaps you could write a small command line driven STiNG
test program, try it under Gem with STiNG running as normal. Then try
it with your game and Pexec() the test program - see if it still
works?

```

Definately!

>Or am i getting the tpl-structure all wrong?

Nope, just one level of indirection out. :-)
Your code needs to store a pointer to the TPL structure.

```
typedef struct    {
int  x;   /* 2 bytes */
}   FRED;

main()
{FRED    f;   /* whole structure (2 bytes) */
 FRED    *ff; /* pointer (4 bytes) to structure but garbage atm */

 ff = &f; /* ff now valid */

 f.x = -5;

 ff->x = -10; /* overwrites the -5 */
}

/    line 1: source file 'c.c'
/    module name c

     .shri

     .globl main_
main_:
/    line 6: 'main_' func int:2
     link a6, $-6
/    line 6: '{'
/    line 6: auto -2 'f' struct:2 '.1'
/    line 7: auto -6 'ff' ptr:4 struct:2 '.1'

/    line 9: ';'
     lea  -2(a6), a0
     move.l   a0, -6(a6)

/    line 11: ';'
     moveq    $-5, d0
     move d0, -2(a6)

/    line 13: ';'
     movea.l  -6(a6), a0
     moveq    $-10, d0
     move d0, (a0)
```

```
/    line 14: '}'
     unlk a6
     rts

/    line 3: typedef 'FRED' struct:2 '.1'
/    line 3: struct '.1' struct:2 1 {
/        line 2::0 'x' int:2
/    }
```

Hey, this is good. I don't have to write any assembler and get it wrong! <G>

>And results of the function, can I fetch them from the stack too? Please
>excuse my tiny knowledge of the C language.

oops, forgot all about that! This one's easy - register d0, either as a 16 bit or 32 bit value. It doesn't matter what 'type' the C source code says it is. If the value boils down to a WORD then it'll be in d0.w (high word is undefined), and if it boils down to a LONG then it'll be in d0.l. As pointers are always 32 bits on the Atari then they'll always be d0.l as well.

Strictly speaking, a C compiler can use any method it wants but fortunately there is a standard method which can be forced upon the compiler. This standard is:

Push arguments starting with the rightmost argument and work left.
Caller must pop the arguments.
Result returned in d0.w or d0.l
'char' is extended to 'int' (ambiguous - more below).

On the Atari the keywords 'cdecl' and 'stdargs' usually appear along with the functions in the header files. They tell the compiler to use the above convention.

The ambiguous bit ...

The basic unit in C is the 'char'. C has a function called sizeof() which simply returns how much space a particular datatype uses in chars. C has no definition of how big a char is in bytes. All it says is that sizeof(char) == 1. A char could take 13 bits for all we know! Another rule says this:

sizeof(char) <= sizeof(int) <= sizeof(long)

Thus, in theory a char could take up the same space as a long. This is a pain so various conventions are used to denote how much space is really used so people with different compilers know when to make adjustments. On the Atari ...

char (signed or unsigned), 8 bit.
long (signed or unsigned), 32 bit.
int (signed or unsigned), 16 or 32 bits. You have to know which

compiler produced the code. :-(

So people (should) use these instead:

```
int8     signed 8 bit value
uint8         unsigned 8 bit value

WORD = int16  signed 16 bit value
LONG = int32  signed 32 bit value

UWORD = uint16    unsigned 16 bit value
ULONG = uint32    unsigned 32 bit value
```

Therefore we all know what we're talking about!

>I just checked in the 'eng_html.lzh' file. It said that i should use the
>cookie to access the 'drv list' structure.

Yep.

>In it there is a pointer to a
>function called 'get_dftab'

Yep.

>(i think it is at offset 10, if i'm not
>misjudging the structure).

It is.

>i should jsr to that function with a pointer
>to a string 'TRANSPORT_TCPIP',

Yes.

>and will get back a pointer to the 'API'.
>But the docs doesn't say where 'tpl' is to be found.

Hmm, the API pointer you mention is what I'm referring to as the TPL pointer! This is confirmed in the source code way back near the beginning of this post.

I'm using an old header file for STiK. STiNG is backwards compatible so I don't think it is a problem this early in the game - but it might be going under a different name. It would be odd but not impossible.

Just to double check, do a search through the header files using "extern" as the search word. You should come across this:

```
extern TPL *tpl;
```

If you don't, can you post what does match "extern" please?

oo - what a long posting! <G>

I can't remember what I did with my cursor. It either behaves like
yours or is displayed only when the whole edit field happens to be
visible.

>You can only have keyboard input to the top window anyway,
>I think...

Er, I can't remember! It's not that I know the answer. I do remember
that I don't. What I can't remember is if I had the cursor active in
the background just in case it turned out to be possible, or whether
or not I bothered ... or not.

If I had better sense I'd be dragging this post to the trashcan! <G>

I thought myself out of that one. It kept nagging me at the back of my
mind that memory config was the key. Then the thought went away and I
was happy again.

>>'resvalid' denotes if the reset routine whose address is in

> as "dotted quads".

I saw something about 'dest_host' when using TCP_open, and it was a
32bit value. Does it mean that the dotted quad is that value, or is the
value a pointer to a string that is for example '123.456.789.012'?

> >My game would have to be able to quickly send data

> saying much - enough to prevent the ISP software hanging up the phone.

I didn't mean that. What i meant was that, when using TCP_open to alert
the destination that there is data coming (I guess that it's used that
way anyway), does the TCP_open call halt the whole system while it waits
for an answer? If it is that way my game would halt during that time,
and then suddenly continue. Very annoying.

> On the other hand, if you had your game running on two machines which
> were connected directly together then there's be no dialling. You'd

> enough to prevent the other one 'hanging up'.
>
> Now you'd have the actual game start. It would open a connection to
> the other machine(s) and they'd start talking.

Yes, i've already thought about it for awhile. Mario Becroft's game
'Manouver' uses a technique where one of the two computers waits for the
other to send him some sort of alert message. I guess he uses TCP_open
and then TCP_send to send the computer's address to the other recipient.
My game, in which I want as many as 8 players, one of the computers
would have to act as the 'master' and the others as 'slaves'. The master
would then just have to sit and wait for the slaves to alert him,
telling him their addresses.

> STiNG does it. The approach is similar to using files. TCP_open is
> rather like Fcreate/Fopen, TCP_send is like Fwrite. There's other

> waiting for you to read it.

I just hope that it isn't exactly like Fopen, because then there would
be that infamous delay which I don't want.

> The design of TCP allows its data packets to find their own way

> these low level problems have been dealt with you'll no doubt be glad
> to hear!

So I won't have to check wether the data is alright, since STiNG has
already requested a resend? Yes, I'm glad to hear that. :-)
It doesn't matter which order they appear. I'll just add some type of
clock-value to the string i'm sending. The recipient will then know if
to use the data coming in or to ignore it. Since the game is a racing
game of type 'Lotus' the cars may jerk a bit, if the connection isn't
fast enough, but that's the players' problem. ;-)

> Is the above in any way helpful?

Ermm, no... ;-) Sorry
Maybe it would be easier with a pseudo-code example. All I need to know
is what to do in some easy steps. The docs just said that there were
"some strings to check". It didn't say what strings, at which offset,
and what they should be.

> >If so

> That just leaves the dialler. Maybe you could dial then run your game?

Yes, of course the game would have to rely on the user already having
established the connection. What I really need to now is if the
STiNG-core uses AES-events for its main loop. And what interrupts it

uses. If it uses Timer A for DMA-operations then I'm out of luck,
because I think that's the way the sound-module replay routine transfers
sample data to/from the DSP. (I use the excellent replay rout by
BiTMaSTeR/TCE)

I just thought of that. :-)
But an answer from Peter Rottengatter would of course be the best. Isn't
he the one who coded the whole thing?

```
> >> move.l  $1008,a0

So when there's just about success/failure then the low word of d0 will
contain zero for success and -1 for failure (or is it the other way
round?)

Good you told me, that 'cdecl' was getting on my nerves since I couldn't
figure out what is was for. :-)

It's also good that I've just started attending a course in C++
programming. Now I'll be able to figure things out myself. ;-)

> Hmm, the API pointer you mention is what I'm referring to as the TPL
> pointer! This is confirmed in the source code way back near the
> beginning of this post.

Excellent! Then I think I'm beginning to get the idea of how to make the
whole thing work. :-)
So to sum it all up: the cookie contains a pointer to the DRV_LIST,
which contains a pointer to a function get_dftab, which, if called with
a pointer to a string 'TRANSPORT_TCPIP', returns a pointer to the API
(TPL) structure. And from there on it's just straight autobahn. ;-)

Thanks for all your help!!! :-)

the dotted quad is the value. Each of the numbers in the dotted quad
is simply an 8 bit number, meaning the above one is impossible :-)

so for an address of 149.76.12.4 you would use the value $954c0c04

> I didn't mean that. What i meant was that, when using TCP_open to alert
> the destination that there is data coming (I guess that it's used that

TCP_open opens a connection to the destination that stays open until you
close it with TCP_close or the other end closes (in which case you will
receive an error when trying to read/write to that handle)

> way anyway), does the TCP_open call halt the whole system while it waits

> and then suddenly continue. Very annoying.

To actually know there is data to read you will need to check yourself,
either by trying to read the data, or by using CNbyte_count.

David

Yes. Btw, each of the four parts of the dotted quad take values in the
range 0..255 thus 9.10.254.11 is $09.$0A.$FE.$0B and is simply passed
to TCP_open as $090AFE0B

>or is the
>value a pointer to a string that is for example '123.456.789.012'?

You get the dotted quad from the resolve() function. The third
argument is the address to which you want the quad written. Just read
the quad and pass it to TCP_open.

>I didn't mean that. What i meant was that, when using TCP_open to alert
>the destination that there is data coming (I guess that it's used that
>way anyway), does the TCP_open call halt the whole system while it waits
>for an answer? If it is that way my game would halt during that time,
>and then suddenly continue. Very annoying.

I dunno if TCP_open blocks or not (it has different modes) but it
doesn't matter as it would be part of the game initialisation and not
be closed until the game finished.

TCP_open establishes a connection to a "socket". There are various
sockets with different purposes. For example, if you wanted to send an
email you'd connect to socket 25 which knows about the necessary SMTP
posting commands. When you're done you'd use TCP_close to disconnect
from the socket. Beware that either end can disconnect from the socket
at any time. Hopefully they do this gracefully by telling each other,
but sometimes this isn't possible (one end might have crashed) thus
TCP has to rely on timeouts. If one of these triggers your code may
have to decide on the action to take - try again - give up etc.

Assuming there's no problems, the main part of your game would send

data using TCP_send. STiNG constructs the TCP packets and 'injects' them into the socket. They find their own way to the destination.

Receiving is similar. STiNG looks at the TCP packets that arrive. Packets that aren't meant for this host (ie they don't match the dotted quad) either get thrown away or are routed to somewhere closer to where they should be going. The ones that match get stored awaiting your code to read them. Use the CNxxx() functions for this (eg CNbyte_count() - it doesn't block if no data is waiting).

>Yes, i've already thought about it for awhile. Mario Becroft's game
>'Manouver' uses a technique where one of the two computers waits for the
>other to send him some sort of alert message. I guess he uses TCP_open
>and then TCP_send to send the computer's address to the other recipient.

This is a bit tricky, mainly because I have little experience in this area. ;-)

You resolve the hostname and get a quad. You then open a connection to a socket using that quad. Somehow the two machines are talking. Ordinarily STiNG acts as a client and relies on your ISP to figure out the rest but it can act as a server. I think one of the machines running the game will have to act as a server, the others will be clients. It doesn't matter which one of them takes on the job of server as long as one of them does and none of the others do.

I really am treading on thin ice here - I could be wrong!

>My game, in which I want as many as 8 players, one of the computers
>would have to act as the 'master' and the others as 'slaves'. The master
>would then just have to sit and wait for the slaves to alert him,
>telling him their addresses.

Although I know nothing about UDP I think it is worth investigating further. I believe it is less complex than TCP and may allow you to let all the machines talk without the complexities of servers etc. Again, I could be wrong but I'd hate to think of you going to all that trouble only to find UDP was a much better solution.

>be that infamous delay which I don't want.

Nope. :-)

CNbyte_count() returns negative if there's an error, the number of bytes waiting if positive, and zero if there's nothing. It returns

immediately.

>> The design of TCP allows its data packets to find their own way

>already requested a resend? Yes, I'm glad to hear that. :-)

Correct.

>It doesn't matter which order they appear.

They'll come out of STiNG in the same order they went in. If a packet
in the middle goes missing you'll not be able to get at the ones after
it until the missing one arrives.

>I'll just add some type of
>clock-value to the string i'm sending. The recipient will then know if
>to use the data coming in or to ignore it.

The paragraph above might annoy you then. Don't worry though. In
reality, if a packet doesn't arrive then usually none of the others do
because the most likely cause is network delays. If that isn't the
problem then the missing packet will turn up so quickly you'll not
notice.

>Since the game is a racing
>game of type 'Lotus' the cars may jerk a bit, if the connection isn't
>fast enough, but that's the players' problem. ;-)

Yes. :-))

Besides, if you're not transmitting much more than movement
information then network delays becomes the only important factor.
There'll be no strain on the telephone line.

>> Is the above in any way helpful?

>
>So when there's just about success/failure then the low word of d0 will
>contain zero for success and -1 for failure (or is it the other way
>round?)

It depends on the compiler. C defines false to be zero and true to be
any values that are not false (it makes sense - really). Simply test
for "not zero" and you'll be fine.

In practice:
Typically, false=0 and true=1 but all too often you'll find true=-1
(logical !false is 1, whereas bitwise ~false is -1). As the boolean
datatype is usually defined in terms of 'int' then bool might be a 16
or 32 bit value giving us four probable 'true's ...

$0001
$FFFF
$00000001
$FFFFFFFF

Hence testing for "not zero" is a really good idea!
Use "not zero" unless docs specifically state different.

>It's also good that I've just started attending a course in C++
>programming. Now I'll be able to figure things out myself. ;-)

I'm off to do a C++ course quite soon as well! <G>

Games programming? Your best choice would be STOS.

>Mais aussi des petits programmes que je peux lancer sous works ou sous
>windows par exemple.

Ah, serious programs! Many people use C. If you use this too you will
be able to get a lot of advice and help.

If you do not want to spend much time learning you may be better using
a Basic. Have you programmed before? If so I guess you will know some
Basic already.

A bientot, chouchou.

If you don't bother to read the news, you shouldn't post questions there
in the first place.

Interrupt programming is a bit tricky, since everything must be right, and

you need to worry about all time behaviour, CPU registers usage, stack access etc. of the code. For this reason, I always write wrapping code in assembler if some C code is to be executed from an interrupt. That wrapping code does all the installation, and saves/restores registers etc. You need to know your compiler *very* well if you attempt to do it without.

Cheers Peter

No, there aren't, not even with the reasons you stated here. If caching filesystems are used, a RESET can leave a bad mess on the harddisk that is, if things go bad, not recoverable. I would never, ever let any executable on my hd do a RESET, apart from the proper shutdown tool. If I find a program that does, it won't stay on my hd any longer.

> if you find someone is tampering with your
> file then theres nothing better than a reset to put them off messing..

It's useless, as after the RESET it will succeed doing it.

STinG runs from the 200 Hz system timer interrupt.

> 2. Is STiNG relying on AES events to run? I turn off AES in the game, so
> the OS won't do anything to my screens.

No. TOS programs using STinG are perfectly possible. Currently, you only need AES for running STING.CPX at boot time to set STinG active (unless you do not want to do it yourself in your code by using the appropriate STinG call), and AES is not needed anymore afterwards.

> should the handler expect to find the pointer to the IP-packet?

It depends on which protocol you want to use. Most likely, it's TCP. For TCP the interface does not support callback functions. You can use callback functions for ICMP or IP though. Whether it's feasible to use IP directly depends on the type of your game, if it allows to run other software parallel, you should not use it. This means no callback. However, the CNget_NDB() is very efficient, so you might want to call it from your VBL code. That avoids callback.

> 4. How do I call the different functions of STiNG in assembler? I saw
> something about 'jsr to the required function', but where are the
> pointers to these functions? And input parameters to the functions,
> should they be put on the stack or in some data/address registers?

The functions are declared classic C style, i.e. parameters go on the stack. For the functions pointers, see the C example code that comes with STinG. Basically, the STiK cookie holds a longword that is a pointer to a structure. This structure contains a function pointer which must be called to gain the address of the array of function pointers. See STING.HYP for a more elaborate explanation. You do not need to bother with this scheme though if you use Ronalds assembler library.

Wrong. If resolve() is called with a dotted quad, it will still attempt
to figure out the mnemonic name (domain name) associated with that address
- basically the usual resolve function the other way round.

> The design of TCP allows its data packets to find their own way

This is more a feature of IP, rather than TCP. TCP acts to make this
invisible for the user.

Then why scare him with it ? ;-)

> I don't know anything about ICMP I'm afraid.

Conceptually, ICMP is above IP, but by definition it is a part of it. It
is a control protocol used to transmit simple network related messages.

> I think UDP is a lower

> level protocol than TCP but I can't remember any details.

UDP is on the same level as TCP, but provides much less features.

Oops, should have said that too in my other message, so I'm glad you
pointed it out, Guy. Should add that pointers too are returned in d0
(not a0 as assembler programmers might have guessed).

Bad move ! Steve Adams had a reason why he wanted programmers to fetch
the TPL pointer via the get_dftab() function ! And that same reason made
me decide to take out the TPL pointer array from the DRV_HDR array
entirely, since it only tempts the programmer to access it directly.

It's the value. The dotted quad is merely a convenient way to write the
IP address, which by definition is a 32 bit word (not 4 bytes).

>> >My game would have to be able to quickly send data

> and then suddenly continue. Very annoying.

No. Apart from the calls that carry the word "wait" inside their name
(TCP_wait_ack() for instance) and resolve, no call is blocking, they
all return immediately.

> My game, in which I want as many as 8 players, one of the computers
> would have to act as the 'master' and the others as 'slaves'. The master

> telling him their addresses.

Then you'd do a passive TCP_open at the master's side, i.e. the master
will become the server. It can simply try to receive data (will get a
E_LISTEN error code as long as not connected), or call TCP_wait_state()
to wait for the TESTABLISH state.

>> STiNG does it. The approach is similar to using files. TCP_open is
>> rather like Fcreate/Fopen, TCP_send is like Fwrite. There's other

It's done in the background, so no delay. Check out from time to time if
you're connected.

> So I won't have to check wether the data is alright, since STiNG has

With TCP, that is not necessary. TCP ensures correct order.

> But an answer from Peter Rottengatter would of course be the best. Isn't
> he the one who coded the whole thing?

Yes. With the exception of the resolve() code which is by Ronald Anderson.

> So when there's just about success/failure then the low word of d0 will
> contain zero for success and -1 for failure (or is it the other way
> round?)

It depends on the function you're calling. Check out the docs. Functions
that only return error codes will return E_NORMAL for success, which is
#define'd to zero.

Cheers Peter

I just had a look at it, and it looked very impressive :-) I couldn't
understand a word of it though, do you intend to release english
versions?

In fact, i'm coding a shutdown tool working under plainTOS. The MagiC shutdown with the STOP folder is a great idea because i can update some of configuration files
during the shutdown. I want extend this idea to TOS. Eg: when i start a TOS session, i use a personal environement, for that purpose, i use a login program,
a set of environemental variables (HOME,USER,...) and a logout program. If i modify my NEWDESK.INF, during the shutdown this file is copying in a special folder (in my home dir, depending on $HOME). In the next session, during the login session, this file is copying in my root directory. The reset is used with plainTOS (not multitasking system) by logout to complete the shutdown and restart
the system.

It seems complex, but with two very simple programs, i have a multiuser environmental
with MagiC, MultiTOS and TOS. Each user has to edit 2 files: login.cnf that performs
somes action during boot and logout.cnf that performs some actions during shutdown.
There is a third file 'login.usr' that describe each user (as /etc/passwd in unix).

If you are interesting in, i'll put this on my web page. But currently it is just a personal usage.

Yes!!! Then it will surely work with my game! :-)
Because the only interrupts I change during startup is the vbl-vector,
and BiTMaSTeR's replay routine probably uses some DMA-interrupt to feed
the DSP.

Excellent. This makes it even more possible.

So is it a 32bit longword where each byte is one part of the dotted
quad, or would i just have to add the parts together?

> I dunno if TCP_open blocks or not (it has different modes) but it
> doesn't matter as it would be part of the game initialisation and not
> be closed until the game finished.

So you mean that i wouldn't have to call TCP_open everytime i want to
send something, i would only have to do it once and then the 'channel'
would stay open? Can i have several connections open at once?

> TCP_open establishes a connection to a "socket". There are various

> sockets with different purposes. For example, if you wanted to send an
> email you'd connect to socket 25 which knows about the necessary SMTP
> posting commands.

Is there some definition of which sockets i can use for my game? I saw
that Mario Becroft's game 'Manouvre' uses socket 13013. Can I use that
one too, or is it only for his game from now on?

> When you're done you'd use TCP_close to disconnect

Does CNbyte_count() return how many bytes there are to read in total, or
how many bytes to read in this 'block'? If the later is true, would I
then have to call CNbyte_count several times until it tells me that
there are no more blocks for me to read?
Does CNget_NDB return the address to the string?

> CNbyte_count() returns negative if there's an error, the number of
> bytes waiting if positive, and zero if there's nothing. It returns

And how do I get the address from which I should read the data? (already
asked this earlier)

> They'll come out of STiNG in the same order they went in. If a packet
> in the middle goes missing you'll not be able to get at the ones after

It doesn't matter. That'll just make the other cars freeze at their
current positions for a while.

> >> As for interrupts, I'm really not too sure. I'll stick my neck out

> >

> >I just thought of that. :-)

I've written a small program that as yet only does the setup. It works
fine, it finds the cookie, calls get_dftab, and also prints who made the
tcp-layer and what version it is. Now i need another falcon to test this
whole thing in a small network. Had better get it.

> >Excellent! Then I think I'm beginning to get the idea of how to make the

As you can read above, it works! :-)

> >Thanks for all your help!!! :-)
>
> No problem. Much better for me than sitting in front of the TV.

;-)

Hello to all !

I begin to be a boring man with my questions ! So my new question is :

Does exist a way to save an IT adress from the system function. I explain me because my english is poor...I want to put a new Interruption adress for example for Timer A. I have one xbios function (xbtimer) to put my new adress and launch the timera but i never see in the system functions a function to restore the new adress (to put the old adress) and restore all...

Thanks

Newsgroups: comp.sys.atari.programmer

Hi everybody,

Sorry to ask for such a simple question but I'm learning GEM, I'm
programming my fist dialog box with buttons, file selector and
editables, and there's a strange thing :
when calling Rsrc_gaddr(), it bombs (2 -> bus error). I tried to
find what's the matter but I've got no explanation by now.

I made my ressource file with Ressource Construction Set v3.0

This is a sample of my source :

```
     /* AES init   */
     ap_id=appl_init ();

     /* VDI init   */
     v_opnwk ( work_in, &handle, work_out);

     /* mouse -> arrow  */
     graf_mouse (0, 0L);

     /* load .rsc file  */
     if (!rsrc_load ("convaxen.rsc"))
          form_alert (1,"[3][Impossible de charger|CONVAXEN.RSC ![DIANTRE]");

     else /* get the adresse of the dialog box DIALOGUE  */
          if (!rsrc_gaddr (R_TREE, DIALOGUE, dial_adrs)) /***IT BOMBS HERE***/
               form_alert (1,"[3][Mauvais fichier|ressource ![GARGL !]");
     /*error*/
```

I've no problem when compiling/linking (variables defined, convaxen.h
included, etc).
Any idea or I'll have to tell Scully & Mulder about this affair ? ;)

Thanks for answers !

Vincent

Me again ;)

I've found the error : the right call is
Rsrc_gaddr (R_TREE, DIALOGUE, &dial_adrs);
                                ^
the prototype is int rsrc_gaddr(int re_gtype, int re_gindex, void *gaddr);

BUT I have defined dial_adrs : OBJECT *dial_adrs so I don't find it very logical to re-precise it ! As an example, we don't write :
char *source;
char *dest;
 ...

str_cpy(&dest,&source) but str_cpy(dest,source) without '&' ...

Vincent

: So is it a 32bit longword where each byte is one part of the dotted
: quad, or would i just have to add the parts together?

As you could have seen in the example, each number in the "dotted decimal" IP address is one byte in the 32-bit longword.

: So you mean that i wouldn't have to call TCP_open everytime i want to
: send something, i would only have to do it once and then the 'channel'
: would stay open? Can i have several connections open at once?

In STiK, TCP_open() is a function that opens a connection so that you can send data to it, and read data from it. It's rather like opening a file. Once it's open, you can send and receive as much or as little data as you want, when ever you want. You can open any number of connections at once.

In a game such as you are suggesting, a sensible method would be for each of the slaves to open a connection to the master. Each slave would have one connection open, while the master would have many connections open - one for each slave. You would probably open the master first, which would listen for connections from a slave. When a slave is started up, it would open a connection to the master. That connection would only be closed when the slave or the master exits.

Presumably the master would keep track of the game parameters. So if your game included moving objects, for example, the master could calculate the positions and continually update all the slaves as to the current position. And when ever a user on one of the slaves performs an action such as moving the joystick, or whatever other inputs your game uses, it would send a message to the master telling it about the change. All this communication would take place over the sockets that were opened at the beginning, when each of the slaves was loaded.

: Is there some definition of which sockets i can use for my game? I saw
: that Mario Becroft's game 'Manouvre' uses socket 13013. Can I use that
: one too, or is it only for his game from now on?

To be honest I have no idea how one should really go about assigning a port number. I just picked that value out of the air. But there shouldn't be a problem, since in my networkable game the user can enter his own port number. This would be useful if the user wanted to run multiple copies of the game at once, each connected to a different person. In such a case the user could enter a different port number for each copy.

Some port numbers, especially the lower ones, are already reserved for various uses. For example port 25 does SMTP, for transporting mail, ports 20 and 21 are for ftp, and 23 is normally used for telnet. User software should normally use higher port numbers.

I admit I'm not extremely familiar with this area, and someone who knows more about it would be better able to advise you.

: Does CNbyte_count() return how many bytes there are to read in total, or
: how many bytes to read in this 'block'? If the later is true, would I
: then have to call CNbyte_count several times until it tells me that
: there are no more blocks for me to read?

Don't worry about the behind-the-scenes operation of the connection. You simply think of it as a stream. CNbyte_count() tells you how many bytes are waiting, it's as simple as that.

: > CNbyte_count() returns negative if there's an error, the number of
: > bytes waiting if positive, and zero if there's nothing. It returns

: > immediately.

: And how do I get the address from which I should read the data? (already
: asked this earlier)

The number of bytes waiting is the return value from CNbyte_count().

: I've written a small program that as yet only does the setup. It works
: fine, it finds the cookie, calls get_dftab, and also prints who made the
: tcp-layer and what version it is. Now i need another falcon to test this
: whole thing in a small network. Had better get it.

You could always run two copies of the program on a single machine. This
is how I tested my networked game during development, and I found it much
easier to do this than set up two separate machines.

What rsrc_gaddr() returns in gaddr depends on the value of re_gtype.
For values between 0 and 6 it return the address of the pointer, for
other values the content of the pointer.

Of course you don't call strcpy() this way, but there's a big difference:

strcpy() just needs a pointer to some string, i.e. the address of the
string in memory. strcpy() therefore isn't able to alter the value of
your stringpointer, but only the memory it points to. You don't expect
dest or source to have another value after calling strcpy(), do you? But
you do so for the rsrc_gaddr()-call and your tree parameter.

For rsrc_gaddr() to retrieve the address of an object tree, you want to
receive a pointer to the tree. If you then only pass the address of
another tree in memory, rsrc_gaddr() will still treat it as a pointer to
a pointer to an object tree, as it couldn't return you the address
otherwise.

An example: You do the following:

```
    OBJECT *tree;

    tree = 0L;
    rsrc_gaddr(R_TREE, INFO, tree);
```

This will cause a crash because rsrc_gaddr() expects OBJECT ** and therefore tries to store the address of your INFO-tree in address 0L, because you only passed tree "by value".

```
    rsrc_gaddr(R_TREE, INFO, &tree);
```

This is OK, as you pass the address of your pointer to rsrc_gaddr(), and it's then able to store the address of your INFO-tree where you want it, because you passed tree "by reference".

strcpy() only needs the pointers passed "by value", because it does not want to change dest or source for you.

It may be easier to understand if you don't look at pointers, but at - say - integers:

```
void f1(int number)
{
    number = 0;
}

void f2(int *number)
{
    *number = 0;
}

int main(void)
{
    int a;

    a = 5;
    f1(a)
    printf("a = %d\n", a);
    f2(&a);
    printf("a = %d\n", a);
    return(0);
}
```

You'd never expect a to be different after calling f1(), and that's exactly what happens. But after calling f2(), a has the value 0, because you passed it "by reference" to a function which expects a pointer to an integer. f2() therefore didn't receive 5 as its parameter, but for example 0x10000L, the memory address where the value 5 of a is stored. Inside, f2() doesn't alter its argument, but the value it points to.

In this example, f1() is like strcpy(), f2() like rsrc_gaddr().

Hope that clears up things a bit.

Ciao

Thomas

In order to do that, wouldn't I have to assign each of the two programs
a different IP? But STiNG only allows one IP/computer, or am I wrong?

Hey all,

    Anyone out there using Lattice C 5.6 on any large (>285 .c files) projects? It seems to crash when attempting to edit a large project. It also fails to link properly by refusing to see the math library. And yes, the libraries are in the order recommended by the manual:

CSNB.O

<about 435 .c files>

LCGSNB.LIB
LCMSNB.LIB
LCSNB.LIB

    If no one has a solution to this, does anyone out there use makefiles with Lattice? Specifically, I need a makefile that will recursively do makes. I can do it with gcc/make, but I'm not quite sure about lc.ttp and clink.ttp with make.

Thanks in advance,

Michael White (michael@fastlane.net)

Hi Atari programmers,

the new release of the Visual Assembler 4.5 pl0 is now available.
Here is a summary of the capacities of this version:

http://www.geocities.com/SiliconValley/Bay/1209/visualuk.html

Version 4.5

4.5 Release 00 by Wax & Gen 7/IX/1998

After nearly one year of hard work, here comes the first Object Oriented Assembler Programming Environment.
[NEW]

* Kernel entirely re-viewed with an "object oriented" programming method.
* Open/evolutive architecture which will allow Network Distributed Applications. (every method-call is like a system message)
* Permits easy class creation and inheritance. (no multiple inheritance for the moment)
* Permits object encapsulation.
* Numerous facilities for programmers compared to C++ thanks to the "local method list".
* Permits easy class import and creation.
* EXCLUSIVITY : the non blocking drop down window-menu. (try it with wind1-menu in SRC/START)
* Infinite Timer and MouseZone automatic sharing to get rid of the GEM limitation. (easy thread programming)
* New library : "Workspace", for programs which need atom-malloc facilities. (for neuron simulation for instance)
* Intelligent internal V.A/programmer error detection with illegal+explanation in (a6).
* Extended debugging with Alert boxes showing methods, parameters ...
* Easy debugging in window with the VA-LOGGER. (a program to be put in accessory)
* User debug messages are possible using the VA-LOGGER. (sources included of course !)
* Keeps the VA 4.1 tree construction for GEM windows, children windows and children objects.
* Warning : Children windows are not yet available in this version !
* Warning : The windows toolabrs are not available in this version, they need the Children Windows.
* Warning : Chained-text object not available in this version !
* Minor bug introduction ;-)

and many more ... lots of libraries, functions and methods.

Michael,

You need to be more specific about when Lattice crashes. Is it when
you try and add more c files ...? Isn't >285 a bit excessive? If
that really is the problem why don't you just combine the source
files to a more workable number or make a library. I have a project
that produces a 400K executable without any problems; no problems
with the math library either. If your project file is flakey, it
could easily produce all kinds of errors in the final link.

Hi, I have a little problem.
I think menu_popup() is the way to go without going with my own lib.
How is it possible to have:
A list popup (very long list, like 300 items) with the scroll bar?
SO far what I get is the scrollbar but up to the maximum of my RSC
height only. (which is 20 lines right now).
SO it works, but display 8 items out of 20.
How do I get a bigger list items without having to create a 1000 lines
RSC tree ;)

Thanks.

Hi there,
i am interestet in programming for TOS systems and i am want to know, what
languages are available. I do some JAVA programming - is there a kind of
JDK for the TOS system.

Thanx for every response,
Nick

I think the only way to have JAVA on a Atari is to use Linux, but it's no
more TOS ;)
Langages on Atari are
asm68k, C, C++ (gnu), pascal, gfa-basic, omikron-basic, STOS basic, forth,
lisp, Eiffel (contact me if you want it !) , maybe other ones ...

> RSC tree ;)

You need to create a tree that contains all items you want to display.
E.g. if you have 1000 items, then you need a 1000 lines high box with
1000 strings.

The popup-tree is very simple, so in your case I would suggest to
create it at run-time, perhaps everytime you need to display it
(depends on how static the contents is). Read the relevant docs in the
Compendium carefully first...

Hello again,
i am looking forward to buy an MILAN 040 - does someone have experience
with this machine ? Is it recommend ? Some years ago i owned a ST - but we
gave him away to buy a PC. So now i am looking for a newer one.

Nick

There is no Java for TOS, as it would be too slow and power consuming.

On the Atari Platform you have access to Basic, GFA Basic, C, Assembly,
Pascal, Lisp, etc...

The answer is simple :

What do you want to make with it ?

I will have a Milan soon....

Ah. That makes a lot of sense. It also explains why Henrik could not
find it. I was relying on some old STiK code from way back!

An attempt at the reverse actually. I formed the impression he *might*
be thinking his code had to deal with some of these issues. It seemed
easier to state what some of the problems were then say "forget all
about it" ;-)

Am I correct in thinking it is less prone to network delays - but at
the 'expense' of TCP?

ie I read some news article somewhere, where someone was moaning that
UDP was slowing down TCP. This could have been a load of nonsense,
hence my suggestion UDP be looked into - in case that article did have
relevence.

Yes, but note what Peter stated: it is simply a 32 bit value - nothing
more. The implication of this is that provided the 32 bit value is
preserved it does not matter how it is physically stored. It just
happens to be this way for us. An Intel machine will no doubt subject
it to byte and word swapping.

>or would i just have to add the parts together?

Nope. No need to do anything with it, except preserve the value out of
the resolver and hand it to the functions which require it.

>> I dunno if TCP_open blocks or not (it has different modes) but it

>> be closed until the game finished.
>
>So you mean that i wouldn't have to call TCP_open everytime i want to
>send something, i would only have to do it once and then the 'channel'
>would stay open?

Yes.

Both ends of the socket stay open until one of the ends decides to
close (TCP_close) it. Typically this will mean "end of game" ...

... but as you can never tell if the other end is still there then
some sort of code has to be in place to handle timeouts. The most
basic response in this case is to close the connection yourself,
perhaps prompting the user periodically (wait/close).

More elaborate code might allow a connection to be re-established and
continued but such a feature would serve no useful purpose here! ;-)

>Can i have several connections open at once?

Yes. Sometimes this is desirable or even necessary. The protocol
assigned to a socket dictates the range of options for software
connecting to it. There are features that must be supported and
(possibly) some that are optional.

You'll either be connecting to a socket which is reserved for 3rd
party use, or to one which is unassigned. Therefore, you'll be
defining the protocol and can do what you like. :-)

Btw, it'd be a good idea to have the default socket number in the user
options rather than hard coding it into the program.

>> TCP_open establishes a connection to a "socket". There are various

There is an RFC specifically dedicated to sockets. It explains which
socket numbers are used by which protocols. It'll also say which are
unused. Try and locate a site with RFC docs on it and do a search for
"socket" or "socket number"(s).

>> When you're done you'd use TCP_close to disconnect

>how many bytes to read in this 'block'? If the later is true, would I
>then have to call CNbyte_count several times until it tells me that
>there are no more blocks for me to read?

Hmm, I'm not exactly sure what you're asking above.

It returns how many bytes are 'waiting' for you - that is the number
of bytes you can get out of STiNG at the current time. The value
itself is otherwise meaningless to STiNG. It is your responsibility to
decide if it has meaning or not.

Very trivial example (but see further below):
If you'd decided to send data in packets of 10 bytes then obviously
you'd be using doing something like this:

```
LOOP
     if (Cnbyte_count >= 10)
          Read 10 bytes -> packet
          Process packet
     endif
ENDLOOP
```

On the other hand, you might simply transmit data as text, in which
case you'd be looking for a carriage return:

```
LOOP
     if (CNbyte_count >= 1)
          Read & Append 1 byte -> buffer
          if (byte equal(CARRIAGE_RETURN))
               Process buffer
          endif
     endif
ENDLOOP
```

>Does CNget_NDB return the address to the string?

eek! I can't remember what that function does I'm afraid! All I've got
is the C header file. :-(

Looking at that, whatever it is CNget_NDB() does, it takes a 16 bit
argument and returns a pointer to a datatype called 'NDB' from which I
can guess at its purpose. That isn't very useful however!

>> CNbyte_count() returns negative if there's an error, the number of
>> bytes waiting if positive, and zero if there's nothing. It returns
>> immediately.
>
>And how do I get the address from which I should read the data? (already
>asked this earlier)

The only function I've used is CNget_char() which simply returns the

next byte waiting. Easy but probably not very efficient. When somebody
else answers, I'll be reading as well. :-)

I am in the finishing stages of my DLL engine for the Atari. (I wanted to have it ready for release late July through early August, but was unable to)

As this is my first programmer-oriented app (previously all my apps were user-oriented), I would like to find out what feature set you would want in a DLL manager.

The manager runs from the AUTO folder, initialises itself, and then scans a folder for libraries.

When it finds one, it will examine it to see if it should be boot loaded. If the "boot me" flag is set, it will load the library, otherwise it is left alone.

Once all the library files in this folder have been searched, the manager will go TSR.

Later, when an application wishes to use a library (or find out if it is already loaded), it can query the manager as to whether the library is available.

If not, it may load a library dynamically and make calls to it.

All calls are via a redirected TRAP vector (although for you speed freaks out there, you can also call a library via a jumptable). Libraries are given a handle number when they are loaded, which is used when making calls to the library, and when unloading the library.

The managers API has the following functions: LibAvailable to find if a library is loaded, LibLoad/LibFree to load or unload a library,

LibFirst/LibNext to enumerate all loaded libraries, LibTest to test a library file on disc, LibCount to count how many libraries are loaded, LibFlagsSet to alter a librarys flags (to make it bootable or not, for example) and LibFileInfo to get the library info block from the library file so that an app can interrogate a library file more closely.

Is there anything obvious library-wise I have left out?

It also has other non-library functionality - such as enumerating the cookie jar, or getting/changing a specific cookie, querying the computers hardware, and so forth.

--

All email sent to my inca address will fail, however I can now be contacted via an intermediary : gem at tos pl net. I would like to apologise to the genuine respondents that this may inconvenience.

Yep I'd be interested even though I've never used C. I'm sure with a bit reading I could eventually figure it out though. Do any of these routines come with decent commented code? Also anything there on disk layouts?

Scott.

I should of posted this in my last responce but...

Does anyone know where to obtain a decent up to date text/document/web page explaining disk layouts. Such as directory sectors, fat sectors, boot sectors e.t.c. Most of the documents I have located seem to be older and the disk formats have changed. Some people here have a great deal of knowledge on this topic and could perhaps post a little article on it if they have the time. This type of information is useful for everyone, not only programmers.

Thanks

   Scott.

There's an option in the modem list with NTWS4 named something like "serial cable between 2 PC's". I installed that and fiddled with RAS to make it a dial-in connection. Using STiK, I got NT as far as realising STiK was sending something whereupon NT "picked up" the line.

Unfortunately, I can't get any further than this due to a PC hardware failure - but it was looking good until then.

The next step would have been to use STiNG for the PPP and get the rest of the NT settings right.

>you as a programmer are looking for?

Personally ...

It's difficult to say as I've no idea what the betatester knows
initially. Some may program, some may not, and each produce different
reports equally valid in their own context.

The thing that makes me the happiest is to see the program behaving
the same in all environments. Even if it's a bug I'd prefer to see all
machines fall foul of it than just a few - because you can bet "that
few" are machines you do not have direct access to. Therefore these
problems can be incredibly hard to fix.

>I have a registered Profile2.2, are there other system programs that
>would give you important feedback?
>is there a Standard Operating Procedure that a beta tester can use?

Just one. Try and break the program, preferably in such a way that
your description will allow others to break it. ;-)

>or is there a prg that would run in the background keeping track of
>system calls etc and writing the info to a text file upon a crash! :-)

The program being tested should write its own debug information.

Firstly, it gives the programmer a much better idea of where the buggy
code lies.

Secondly, even the programmer may not have any idea what system calls are invoked by his use of a particular call.

The are bugs in compiler library code and bugs in the operating system. If the programmer cannot not be sure exactly which bit of his code is producing the problem then he'll never be able to say his code is really okay - that something else has caused it to fail by forcing that bit of code to deal with data is should not have to.

>So far I have been just writing down what happens when a prg does a
>crash or something unexpected; along with a Profile2.2 report.
>Is it good enough?

Yep! <G>

Yes. Other's have answered it.

>I want to
>say, clic on button, object...on a window which isn't on top ?

When background mode is active the window will behave as though it
were on top as far as programming for it is concerned. On systems
which don't support the feature the window will be topped first, and
you'll have to click again just like normal. On systems where the
background mode is active then you need to click on the menubar to get
it topped.

Aside from the obvious use, using this mode is a darn good way of
testing your redraw code works properly! :-))

As I understand it ...

The first 4 bytes are an index value, followed by the filename. This index value is present in order to support systems where two or more distinct files of the same name may exist - it allows you to distinguish between them.

In compatibility (ie 8+3) mode the filename starts at the beginning like you'd expect.

It simply means you cannot use wildcards or regular expressions
directly with Dreaddir. You mus read all the items in the dir and then
test the names against wildcards/regexp. yourself.

> distinguish between them.

No, it's the other way 'round. On filesystems like MinixFS, files may be hardlinked, i.e. two (or more) directory entries refer to the same file on disk. This is achieved by inodes, each of which conatains all information about the file/dir, like timestamps, length, type, access permissions and which blocks on disk belong to the file. A directory entry on such a filesystem thus does only contain the filename and a reference to the inode. The inode itself has a unique number and a usage count, which is > 1 if more than one directory entry is linked to it.

This inode number is what's returned by D(x)readdir() (also to be found in the index-field of the XATTR structure) and allows to detect whether two different directory entries refer to the same file.

Also note that deleting a file on an inode-base filesystem actually means removing the directory entry decreasing the link count of the inode. Only if it gets zero, the inode itself and the file blocks will be deleted. That's why under UNIX, the system call to remove a file is called 'unlink()'.

Another nifty thing some (or most) inode base filesystems allow you: Opening a file for reading or writing also increases the link count of the inode. Thus, you can safely remove the directory entry after opening the file. The used blocks get automatically freed as soon as the file is closed, as the link count of the inode gets zero, then.

> In compatibility (ie 8+3) mode the filename starts at the beginning
> like you'd expect.

Well, compatibility mode is more a less a "no-no" ;) It does not have any significant advantage over Fsfirst()/next().

Ciao

Thomas

Hi !
I would like to use the Drag'n Drop protocol. The only documentation I have,
is the good old lame Compendium, and it is not clear at all. It says that
my APP should recieve a header wich indicates the data lenght. But at the

same time, it gives a file name plus an other string (wich I dont understand
the meaning).
Would it be possible that one of you gives me a small source code ?
Thanks.

>come with decent commented code?

Yes. The routines actually form part of one of my object libraries
which is good news in this respect. I document these at two levels: in
the code like everybody else; and also in special comment markers /*[
and]*/ which can be extracted by a small utility and appended to a
helpfile - 'cos you can guarantee I'll have forgotten how to use it by
the next day! :-)

As an example, here's one of the modules ...

```
#include <cpu.h>
#include <mem.h>
#include "msdos.h"

MSBOOT*
_ms_stb2msb(m,s)
MSBOOT   *m;
STBOOT   *s;
/*[  MSBOOT*  _ms_stb2msb(m,s)
     MSBOOT   *m;
     STBOOT   *s;

_ms_stb2msb() converts a Motorola boot sector to Microsoft format
and returns 'm' to the caller. 's' is the Motorola block,
'm' the Microsoft block.

Note that if s->stb_boot is not NULL then 482 bytes of boot code
is copied from s->stb_boot to m->msb_boot. A NULL value ensures
this does not happen. Note that no format conversion is done on
the boot code.
]*/
{
 /* copy 'bra,oem' as is */
 qmemcpy(&m->msb_bra[0],&s->stb_bra,8);

 /* 24 bit serial no. */
 cp_wrol(&m->msb_serial[0],cp_86long(s->stb_serial));

 /* bytes per sector */
 cp_wrow(&m->msb_bps[0],cp_86word(s->stb_bps));

 /* sectors per cluster */
 m->msb_spc[0] = s->stb_spc;
```

```
 /* reserved sectors unused by TOS */
 cp_wrow(&m->msb_res[0],cp_86word(s->stb_res));

 /* number of FAT tables */
 m->msb_nfats[0] = s->stb_nfats;

 /* number of possible directory entries */
 cp_wrow(&m->msb_ndirs[0],cp_86word(s->stb_ndirs));

 /* number of sectors on media */
 cp_wrow(&m->msb_nsects[0],cp_86word(s->stb_nsects));

 /* media descriptor, unused by TOS */
 m->msb_media[0] = s->stb_media;

 /* sectors in a FAT table */
 cp_wrow(&m->msb_spf[0],cp_86word(s->stb_spf));

 /* sectors in a track */
 cp_wrow(&m->msb_spt[0],cp_86word(s->stb_spt));

 /* number of sides on media */
 cp_wrow(&m->msb_nsides[0],cp_86word(s->stb_nsides));

 /* number of hideen sectors, ?unused by TOS? (zero) */
 cp_wrow(&m->msb_nhid[0],cp_86word(s->stb_nhid));

 /* ?copy boot code? */
 if (s->stb_boot != NULL)   qmemcpy(m->msb_boot,s->stb_boot,482);

 return m;
}
```

>Also anything there on disk layouts?

Not in english but in code, yes. There is stuff to manipulate the bootsector, FAT(s) (12 or 16 bit), and root directory. It's easier if I just post the header file msdos.h. That way you can see for yourself exactly what functions and macros are in it ...

I found the compendium to be very clear on this. It actually gives a step-by-step guide on how to do it. I managed to get a routine going 1st try after reading this. Sure you read the appendix, about the Drag&Drop?

Anyway, if you haven't been able to get some help, send me a private mail, and I'll let you have my Drag&Drop routine.. it's all ASM..

Hi!

JACCARD Emmanuel <softjee@wanadoo.fr> wrote:
> It is possible to access to a window which is not topped ? I want to
> say, clic on button, object...on a window which isn't on top ?

Another way (besides the already mentioned WF_BEVENT) is to interpret the "WM_TOPPED" message differently, i.e. do not directly top the affected window, but check whether the mouse pointer is currently over an object of interest and handle it like the object was clicked.

Of course, this is a bit of an abuse of GEM messages, but it works with all AESes.

Also note (using either method) that clicking on a free area of the window should always be interpret as "top this window", because otherwise it's very annoying if you can't top the window anymore (except the border elements when using WF_BEVENT).

Ciao

Thomas

Yes, multitasking OSes like Magic provide the user access to scroll
bars, arrows, etc. to windows that are not the top window. Your
should always make certain you set the clipping rectangle (vs_clip())
according to the rectangle you get when 'walking' the rectangle list
in GEM.

Single tasking OSes usually do not allow access to any bu the top
window.

No special things to do programming wise. If you don't perform
clipping correctly, there will be some strange side effects when, say,
clicking the scroll bar, and the window underneath overwrites the top
window without becoming the top window, etc.

Hi everybody,
i would like to know how perform a cold and a warn reboot
under plain-TOS (a C example will be welcomed).
Thanx for yours answers.

Hi everybody !

I thank you for your answer about "windows".

Now i have a new problem....If you can help me !

I want ot use XBIOS call in a interrupt but its seems there're somes problems.
The interrupt is the TIMER A, i mask all the other and i call my XBIOS function. This call don't run, the stack seems to have a problem after this calling....

So i can't use XBIOS call in interrupt ?

Thanks to all !

Under what AES does this happen? Surely not under N.AES, and I'll be
very surprised if MagiC or Geneva does this as well.

I have found this with all AESes. I must admit that it was a LONG time since
I looked at it and fixed it so I don't exactly remember what needed changing
(I think it's form_button which need attention), but I'm sure all AESs had the
problem and still has it.

This does ofcourse only happen when the window you are using is in the
background and is partly covered by another window. How could the AES know
"where" the object tree is to be drawn anyway? It does not have any clue if
it's coverd by another window or not and it's up to the user to clip it. If
you then use form_button (or whatever it's called...), which is the normal way
of handling button clicks inside a window when a dialog is used, the AES will

just draw the selected button without any clipping. For edit fields you will
see that the "marker" will draw right over the window in front as well.

Yes, exactly you can't !
That is because most, if not all, of the ROM routines
are written in a non reentrant manner, that is, you can't call a function
from XBIOS (e.g.) from an Interrupt, while any other XBIOS routine is
running, that corrupts part of the information the "noninterrupt" call
is relying on. That may cause a crash, but does not have to crash, as in
your case, where just your stack gets corrupted.

: Thanks to all !

Hi!

Konstantinos Xonis <gc85@vision.hrz.uni-giessen.de> wrote:
> Yes, exactly you can't !

According to the Profibuch (and personal experience) it is possible to
use BIOS and XBIOS calls from within an interrupt handler, with some
restrictions. The trick is to manually alter the pointer to the memory
area where TOS' trap dispatcher saves registers and return address:

(Code sample taken from Profibuch):

```
savptr = $4a2
amount = 46

; Beginning of interrupt handler
interrupt_routine:
    sub.l   #amount,savptr.w

    [Use BIOS- and XBIOS-calls]
```

```
; End of interrupt handler
    add.l   #amount,savptr.w
    rte
```

The most important restriction: Only one interrupt handler may do this at the same time. Also, the storage savptr points to cannot handle more than three recursions (i.e. it only lasts for 3 * 46 bytes). Another problem that may arise is that TOS' trap dispatcher doesn't lock interrupts when saving/restoring registers, so an interrupt which uses the above trick possibly occurs exactly in that moment, which will also cause serious problems.

But so far I haven't experienced many problems in "real life". TOS2GEM uses this method (a bit different, because it uses its own savptr-area and a temporary supervisor stack) for the VBL-driven refrehs - which even call the VDI! So far no one has ever reported problems, but as it's still possible something goes wrong on some special system, the VBL-refrehsh can be disabled by an external program.

Ciao

Thomas

OK, i have to admit, I did not knew that, but to have the last word ;)
it is a work around !

"Natively" TOS was not meant to call OS routines from IRQ handlers, I think.

But you are right, it is possible !

Hi everybody!

I'm very interested in using STiNG in my game called Reeking Rubber (for

the Falcon030), to give the ability of multiplayer mode. I code exclusively in assembly-language.
I've looked at some docs about coding sting, but it didn't give me the essential information I need, like:

1. Does STiNG need a VBL-interrupt to be able to run, or is it driven by some other interrupt? Now my game replaces the vbl-vector at $70, so no other vbl-interrupts are carried out. IOW my game does not use XBRA to link my vbl-routine inbetween the others, because the routine needs to be the first to be executed each VBL, to avoid flickering on the screen.

2. Is STiNG relying on AES events to run? I turn off AES in the game, so the OS won't do anything to my screens.

3. I've understood so far that it might be a good idea to let STiNG call a handler to take care of incoming IP-packets, and that I can patch in my own handler. It's just that the few examples available is in C. Where should the handler expect to find the pointer to the IP-packet?

4. How do I call the different functions of STiNG in assembler? I saw something about 'jsr to the required function', but where are the pointers to these functions? And input parameters to the functions, should they be put on the stack or in some data/address registers?

Thanks in advance
Henrik Gild (Hencox/Nature)

But it's a workaround documented by Atari in "Hitchhiker's guide to the BIOS" (IIRC). So it's an official way to do it.

Ciao

Thomas

The obvious question is why? ;-)

>Thanx for yours answers.

I've never had a need to do this but as no-one else has answered I'll
give it a bash. Even more amazingly I'll do with without the safety
net of having an Atari to try it on just now! <g>

There seem to be four system variables associated with this:

```
uint32   *memvalid=0x420;
uint16   *memctrl =0x424;
uint32   resvalid =0x426;
```

```
uint32   *resvector    =0x42a;
```

and the reset address for the cpu is:

```
uint32   *resetpc  =0x004;
```

'memctrl' is a copy of the value which got written into the memory controller. I'll ignore it.

'memvalid' is a flag denoting if the controller's config is valid. It must be - we're running, so I'll ignore that also.

'resvalid' denotes if the reset routine whose address is in 'resvector' is usable or not. I assume this is the warmstart code. Also it makes sense that the next reset will be a warmstart unless we force otherwise.

Finally, I have a vague recollection the value of PI is used to denote that 'resvector' is valid. I also assume the contents of 'resvector' has already been set to a warmstart routine by the system.

The code, based on the above assumptions ...

```
void
Reset(bool coldstart)
{uint32 pi    =0x31415926L;
 void    (*fcp)()  =*resetpc;

 (void)Super(0L);
 *resvalid = coldstart ? ~pi : pi;
 (*fcp)();
}
```

Nope. It is re-entrant to 3 levels but not from interrupts. To stand
any chance of using it you'd have to be able to restore the xbios
context prior to making the xbios call *and* know exactly what that
call did internally.

I seem to recall (from years back) there being an "in-dos" flag in
MSDOS which msdos would set when it was being called. A TSR could sit
there polling the in-dos flag until it was clear, at which point it
could make a hurried dos call. I mention this because MagiC has an
entry of the same name. It *might* be possible it serves a similar
function. Mind you, if you're using MagiC then better solutions could
be found via multitasking.

Anyway, best to keep things simple. If possible, just have your
interrupt set a flag in memory. The flag in turn can be the trigger
for another piece of code (the main app, desktop accessory, or
parallel process under multitasking) to make the xbios call under
better circumstances.

MagiC, version 2 at least. That was the environment being used while I
was implementing this sort of background code. Frankly I'd expect the
same behaviour from all AES's.

For an AES to be able to automatically deal with background windows it
would either have to posess a 'multi-clipping' rectangle list or walk
the redraw rectangles. From a programmer's aspect such a feature would
be pointless as you'd still have to cater for AES's which did not have
the ability. It follows that there is little incentive for a designer
to add it either.

The root cause of the problem is objc_draw and objc_change. I can't

remember the details but little niggling inconsistencies with
objc_change resulted in me "emulating it" with objc_draw.

And what a pain tracking the edit cursor is! ;-)

Hi,

Does anyone run STOS under Pacifist ? Could I have a look at your Pacifist
config file,
since I am having problems getting it to work.

Thanks

Harvey

Tanks to you Thomas and Konstantinos XONIS which repond me. The routine of
Thomas is rigth and now i haven't any bug !!! So thanks to you Thomas ! Do
you think this tips can run on Hades (i think yes) and Milan ? (i don't
know...)

Another question, why the number 46 ?

Thansk a lot.

You're welcome. And I don't see an obvious reason why it shouldn't work
with the Hades or the Milan, too.

> Another question, why the number 46 ?

This area is used by the trap dispatcher to save registers d3-d7/a3-a7
(10 * 4 bytes), the status register (2 bytes), and the return address (4
bytes), making a total of 46 bytes.

Ciao

Thomas

It might work but I doubt it. STiK, the predecessor to STiNG
implemented a non blocking resolver and iirc this relies on the AES.

For an informed answer, hope Peter responds! He'll also be able to
answer (1).

>3. I've understood so far that it might be a good idea to let STiNG call

I'm not at all sure what you mean here, but essentially, the Transport
Layer (below) has calls to do what you what.

>4. How do I call the different functions of STiNG in assembler? I saw
>something about 'jsr to the required function', but where are the
>pointers to these functions?

In the TPL structure which is declared in the transprt.h file. You'll
see a line ...

```
extern TPL *tpl;
```

... which is the base address through which all the functions are
located. The variable 'tpl' is a pointer to the datatype TPL. Take the
TCP_open call for instance. It's declared thus:

```
typedef struct tpl {
[snip lots of other declarations]

int16    (*TCP_open)(uint32, int16, int16, uint16);

[snip lots of other declarations]
}    TPL;
```

Further down there's some macros which make it easier for C
programmers to use them. The one for TCP_open is ...

```
#define TCP_open(h,p,t,o)       (*tpl->TCP_open)(h,p,t,o)
```

So, when you see ...

```
TCP_open(arg1,arg2,arg3,arg4);
```

... in example C code then you should read it as ...

```
(*tpl->TCP_open)(arg1,arg2,arg3,arg4);
```

The TPL structure is quite large. It'll be easier to explain with a smaller example:

```
typedef struct fred    {
uint16   (*x)(int16,char*);
void (*y)(int32);
int16    (*z)(void);
}   FRED;

extern FRED   *f;

#define  CallX(a,b)    (*f->x)(a,b)
#define  CallY(d)  (*f->y)(d)
#define  CallZ()       (*f->z)()
```

Lets imagine you see this in the C code:

```
CallX(0,"Hello");
```

It's a macro so read it as:

```
(*f->x)(0,"Hello");
```

You then need to find out what 'f' is. Looking back it turns out it is a structure of type FRED. FRED contains 3 functions, or to be more precise, FRED contains 3 addresses - one for each function x(), y() , z(). If FRED happened to start at memory address $1000 then the address of function x() would be at offset 0 ($1000), the address of function y() follows at offset 4 ($1004) and finally comes z() 4 bytes later at offset 8 ($1008). CallZ() [which is really (*f->z)()] is nothing more complex than

```
move.l   $1008,a0
move.l   (a0),a0
jsr  (a0)
```

Forgive my assembler - it's been a long while, and the MWC assembler uses really odd syntax! The same applies to TPL. You have to go through it from the beginning figuring out what the offset is for each entry. Afair all the TPL offsets are 4 bytes.

Fine, but we need to know the real base address. This is where 'f' comes in. It holds a pointer to it. Let's say 'f' contains the value $2000 then (*f->z)() would be

```
X    =0
```

```
Y    =4
Z    =8
move.l   f,a0     /f
movel.l (a0),a0        /f->
adda.l   #Z,a0         /f->x
move.l   (a0),a0       /*f->x
jsr  (a0)     /(*f->x)()
```

The first few entries in TPL are:

```
typedef struct tpl {
/* offset */
/* $00 */ char *module;
/* $04 */ char *author;
/* $08 */ char *version;
/* $0C */ char*    (*KRmalloc)(int32);
/* $10 */ void (*KRfree)(char *);
/* $14 */ int32    (*KRgetfree)(int16 x);
/* $18 */ char*    (*KRrealloc)(char *, int32);
/* $1C */ char*    (*get_err_text)(int16);
/* $20 */ char*    (*getvstr)(char *);
/* $24 */ int16    (*carrier_detect)(void);
/* $28 /* int16    (*TCP_open)(uint32, int16, int16, uint16);
[etc]
[snip]
}    TPL;
```

The base pointer is:

```
extern TPL    *tpl;
```

The correspondong macros are:

```
#define KRmalloc(x)             (*tpl->KRmalloc)(x)
#define KRfree(x)               (*tpl->KRfree)(x)
#define KRgetfree(x)            (*tpl->KRgetfree)(x)
#define KRrealloc(x,y)          (*tpl->KRrealloc)(x,y)
#define get_err_text(x)         (*tpl->get_err_text)(x)
#define getvstr(x)              (*tpl->getvstr)(x)
#define carrier_detect()        (*tpl->carrier_detect)()
#define TCP_open(h,p,t,o)       (*tpl->TCP_open)(h,p,t,o)
```

So to call TCP_open() we fetch the pointer out of 'tpl', indirect through it to get the TPL base address. Add the TCP_open offset $28, which gets us to the right part of the TPL structure. Read the contents of the address there, then jump through it.

```
move.l   tpl,a0        /tpl
move.l   (a0),a0       /tpl->
adda.l   #$28,a0       /tpl->TCP_open
move.l   (a0),a0       /*tpl->TCP_open
jsr  (a0)     /(*tpl->TCP_open)()
```

>And input parameters to the functions,
>should they be put on the stack or in some data/address registers?

The stack. C functions push arguments right to left and the caller
gets to unstack them - just like Tos. To complete the above example:

```
uint32   a;
int16    b;
int16    c;
uint16   d;
TCP_open(a,b,c,d);

move.l   tpl,a0        /tpl
move.l   (a0),a0       /tpl->
adda.l   $28,a0        /tpl->TCP_open
move.l   (a0),a0       /*tpl->TCP_open
move.w   d,-(sp)       /push args
move.w   c,-(sp)
move.w   b,-(sp)
move.l   a,-(sp)
jsr  (a0)     /(*tpl->TCP_open)()
adda.l   #$0A,sp       /pop args
```

I forget offhand what registers are preserved/destroyed. Probably the
same as a Gemdos call etc.

> The name of what?

The function responsible for this mess. It's form_button() for the
buttons and for the cursor I have no idea... I fixed it by simply dissabeling
the cursor in the windows not being on top and enabled it when it gets
active/topped. You can only have keyboard input to the top window anyway,
I think...

:-)

You are wrong. ;-)

MGIF can be configured for 'point to type' (keyboard entry into the window
below the mouse pointer even if it is partially obscured).
I don't think I made this the default, though, since some people might get
confused (I'm used to X myself and even configure Win95 this way).

Naturally, you can't use the standard text cursor if you do this and the
current (even beta7+) XaAES (don't know about other alternative AESes) has
some trouble with it.

Yeah, I can not live withpout it under Solaris. I guess you have done your own keyboard handling then. Because I'm almost 100% sure that normally they keyclicks will go to the window on top. I have to try this...

> Naturally, you can't use the standard text cursor if you do this and the

Would I have to resolve an IP-address (like 123.456.789.012) before sending any data to a recipient? Isn't resolving actually for translating 'human' addresses (like www.anyhost.com) into IP-addresses using a DNS-server? My game would have to be able to quickly send data without confirming any connection otherwise the whole came would stop while connection is being established.

Well, I read in the docs something about the transfer of IP-packets

being just 'above' the TCP,ICMP,UDP layers. So when sending an IP-packet you may choose which of the protocols to use. I didn't see anything about there being a handler to handle TCP packets, but I may have missed that.

```

> }       TPL;
```

Does the STiNG-cookie contain a pointer to this tpl-structure? If so then i've understood how to call for example tcp_open. But I would still need to know the essentials like if STiNG requieres a VBL-interrupt and AES.

```

> uses really odd syntax!
```

Actually wouldn't it be right with:

```
move.l   $1008,a0 get pointer at $1008
jsr  (a0)     use that pointer to jsr to
```

Thats the same way I call my joystick-reading routine in the game.

```
> So to call TCP_open() we fetch the pointer out of 'tpl', indirect

> adda.l  #$28,a0         /tpl->TCP_open
> move.l  (a0),a0         /*tpl->TCP_open
> jsr     (a0)            /(*tpl->TCP_open)()
```

But isn't 'tpl' already the address to the whole tpl-structure? So wouldn't
move.l   (a0),a0
take out the first pointer in the tpl-structure, which is *module? You said your assembler was a bit rusty, eh? ;-)
Or am i getting the tpl-structure all wrong?

And results of the function, can I fetch them from the stack too? Please excuse my tiny knowledge of the C language.

I just checked in the 'eng_html.lzh' file. It said that i should use the cookie to access the 'drv list' structure. In it there is a pointer to a function called 'get_dftab' (i think it is at offset 10, if i'm not misjudging the structure). i should jsr to that function with a pointer to a string 'TRANSPORT_TCPIP', and will get back a pointer to the 'API'. But the docs doesn't say where 'tpl' is to be found.

Regards
Henrik Gild

I have just used standard PaCifiST settings....

what TOS version, and what STOS version are you using?

You probably want to upgrade your STOS, or downgrade your TOS (early STOS versions are incompatible with 1.62 - 2.06 versions [depending on which STOS you are useing]. Current STOS will work on them all of course.

Why is it that the LocalTalk module (by "Uknown Programmer") in STiNG has options for Ethernet-cards like VME and Riebl? What on earth has that to do with LocalTalk? The type is "serial bus type" which would be correct, but then you'd probably want to use a LocalTalk tranceiver for RS-422, but there's no option for Serial Bus Type on LAN ...
   Is there serial bus type options that works in STiNG? Ethernet for example, does it work allright? If it does and you can select LocalTalk adapters, you can easily connect Mega STe's and Falcons by their LAN ports at least for raw TCP/IP, the AppleTalk protocool is a totally different

matter.

Have you got a safety line instead.

>There seem to be four system variables associated with this:
>
>uint32 *memvalid=0x420;

You missed out these 2:

uint32 *memvalid2   =0x43a;
uint32 *memvalid3   =0x51a;

AFAIR memvalid3 is present, but unchecked, under TOS 1.0. It is checked under TOS 1.62 and, probably, TOS 2+.

>uint16 *memctrl =0x424;
>uint32 resvalid =0x426;
>uint32 *resvector   =0x42a;
>
>and the reset address for the cpu is:
>
>uint32 *resetpc =0x004;
>
>'memctrl' is a copy of the value which got written into the memory
>controller. I'll ignore it.

That's fine.

>'memvalid' is a flag denoting if the controller's config is valid. It
>must be - we're running, so I'll ignore that also.

Bad move. If memvalid == 0x31415926, memvalid2 == 0x237698aa and, for TOS 1.6+, memvalid3 == 0x5555aaaa then a reset will be warm. If any of these don't match the 'magic number' then a cold reset is performed. The difference between a cold and warm reset being the check to find out how much memory is available.

>'resvalid' denotes if the reset routine whose address is in
>'resvector' is usable or not. I assume this is the warmstart code.

Ooo, assumption is the mother of all programming nightmares. The reset routine pointed to with resvector is one that is called before TOS is initialized and has nothing to do with warm/cold resets. As an aside to this, this is the way the ghost virus stays resident through warm resets.

>Also it makes sense that the next reset will be a warmstart unless we
>force otherwise.
>
>Finally, I have a vague recollection the value of PI is used to denote
>that 'resvector' is valid.

That's right.
>   I also assume the contents of 'resvector'
>has already been set to a warmstart routine by the system.

See above for my feelings about assumptions :)

```
>The code, based on the above assumptions ...
>
>void
>Reset(bool coldstart)
>{uint32 pi   =0x31415926L;
> void   (*fcp)() =*resetpc;
>
> (void)Super(0L);
> *resvalid = coldstart ? ~pi : pi;
> (*fcp)();
>}
```

Almost right. The only thing wrong with the above is you're playing with the wrong *???valid. The code required is almost the same, as below:

```
void
Reset(bool coldstart)
{uint32 valid =0x752019f3L;     /* magic for memvalid */
 void    (*fcp)() =*resetpc;

 (void)Super(0L);

/* clear memvalid. results in memory check/cold boot. */

 *memvalid = coldstart ? ~valid : valid;
 (*fcp)();
}
```

Still, since you didn't use the safety net, and therefore couldn't test it, that's not too bad.

BTW, is the LAN port on the Falcon compatible with RS232 ? I mean I
would like try to connect my modem to the LAN port (with a Mac cable ?)
and then use the Modem2 to talk with a PC (using a nul modem cable I
suppose).
What would be the wiring between the modem (DB9) and the LAN port ?

BFN,
/Pascal/

Someone wrote me a message yesterday I think. They stated the information I have on the disk formats is outdated. They then continued to explain how the new disk formats are layed out and how to access them. Well something went wrong with my server and I lost some of the messages. This particular message I wanted to download and save and of course was one of the ones that got chucked. Could this personplease send it again if possible.

Scott.

So, how does one call _appl_yield()? Is it just

```
_appl_yield:
     move.w   #$c9,d0
     trap #2
     rts
```

(I haven't delved too deeply into the GEM trap vector)

Are there any restrictions on calling it?

Is it OK from a TOS app?

Is it OK from User mode, or does it require Supervisor mode?

Assuming other tasks aren't resource hogs (CPU/disc etc), how quickly will I get control again? If all other tasks are idle, I'd assume it'd be pretty much immediately.

Given code of the form:

```
  appl_init()
  do GEM stuff
  appl_exit()
  ...
  for a = 1 to largenumber
    do stuff
    if (a mod 100) equals zero  ; remainder( a / 100 ) = 0
      _appl_yield()  ; yield to other processes every 100th iteration
    end if
  next a
  ...
```

will this be OK?

(Just thinking aloud)

No offense taking.

Well what better way to learn. I'm doing it for experience and I find
hands ist he best way. Reading about what everything does and
understanding it is different than seeing why it does it and making it
do it.

> Also, there are already a lot of programs which allow undelete and/or

Refer to what I said above. What about if we only had one of everything in
the world. One STOS program with no new add ons, one art package, e.t.c.
If we only had one of everything none whould have the right to choose :)

Salut:
I sometimes volunteer to do beta testing, but as of yet I've never been
told what the programmer I am beta testing for wants!!
odd and irksome.
so tell me, if you ask for beta testers for feedback, what is it that
you as a programmer are looking for?
I have a registered Profile2.2, are there other system programs that
would give you important feedback?
is there a Standard Operating Procedure that a beta tester can use?
or is there a prg that would run in the background keeping track of
system calls etc and writing the info to a text file upon a crash! :-)
So far I have been just writing down what happens when a prg does a
crash or something unexpected; along with a Profile2.2 report.
Is it good enough?

hi all

i am 50% through the production of my new site,

it aims to decrease the time it has taken me to
find some software for my falcon, including magic
specific or enhanced applications,

the site will include all the software i have found
useful (shareware+pd) that i have downloaded from
different sites and hard to get english versions
and translations.

it's not finished yet but is coming up on 150 different
items, most of which will be for direct http download,
the rest are links to the authors/supporters site where
more can be found out.

stand by for more info!

ian norton :)

Try this:

I have a 24meg TT and a 333Mhz Dell PC

They are talking to each other using Connect on my Atari, and Hyperterminal
on the PC and both utilising ZModem protocol..

I've got a Null Modem cable hooked into the two computers com ports (from
Maplin - £6.00).

Data transfer rate at 19,200 baud is about 10mins per Meg, but I'm working
on it.

hi ken.
I will just speak for myself, as I know that other programers will ask
a total different thing.
in my opinion, Just the fact that many betatester try a version is
good, because of the different computer/os, setup, auto order, special
tsr, acc etc.
When a betatester experience prob. I hate a simple: "Version x.xx
doesn't work. it crashes!"

What I expect is a small report, on When does it crash exactly? is it random? What is the message when it crashes? What kind of crash? When it crashes, can you reproduce it under another OS? fastram settings? memory protection? Those kind of things are normally done directly by the user trying to get the sofware stable.
Example, I have few prog I know what to do and NOT to do to not crash. This really helps me.
Also a report of the exact auto folder order, or acc.
anyway that's basically how I see it.. probably many other things I forgot.

Thanks a lot it was the version I have, I have find the bug so it work
now. For information if with GCC I don't use an optimisation option it
don't work. It's not a problem but it was difficult to find!!!

regards

Hi!

  ABISource have launched an "opensource" project, it's currently a Linux
and WinNT project, but... I woudn't mind if someone would like to port it

to Mint or TOS...

More info on:
  www.abisource.com

  But someone may say, "Oh no, not another hoax project. Remember that Mac OS that turned out to be a copy of Linux source files". I'd like to quote a message posted on Slashdot, "AbiSource is primarily people who worked for Spyglass, Inc ". Well, I think those guys know what they are doing. Atleast they have a pretty cool logo.

Regards..

Ken Macdonald (macdonald@cfcsc.dnd.ca) wrote:
: I sometimes volunteer to do beta testing, but as of yet I've never been
: told what the programmer I am beta testing for wants!!

There are several reasons why it's helpful to have other people testing your software.

Often the author of the software knows what should and should not be done with the software, and fails to test other possibilities. An other person who is unfamiliar with the software will try out operations that the programmer would never have thought of, and often show up bugs that way that the programmer would never have noticed.

The other aspect is getting the software tested on many different computer configurations. By getting a number of people to test the software, you will find out when the software doesn't work on more unusual hardware or software configurations, or configurations that the programmer didn't think of trying or was unable to try himself.

And finally, it is also very helpful to get feedback on the design and documentation of the program. Although what usually happens here is that you have to make compromises and you cannot please everyone, the suggestions from various people are always useful.

So what should a beta tester do? There are several approaches which are all relevant. Firstly, don't think "I'm beta testing this software, what have I got to do?" but rather, simply use the software in the way that you would do if you weren't beta testing it. Pretend you're an ordinary user who simply wants to get things done with the software. Then when you notice inconsistencies in the software's operation, or crashes, or if you see any areas which could be improved, make a note of it.

Secondly, deliberately do stupid and/or unusual things with the software. For example if you were beta testing a word processor, try loading a binary file into it. Try typing unprintable characters. Try cutting and pasting a spreadsheet document into it, even though you know it doesn't support this. Try editing really huge files. Try loading text files of other formats that the software doesn't recognise, and check that it shows a friendly warning message instead of crashing or behaving unpredictably. Try choosing menu options even if they obviously do not apply to the present situation. Try clicking on all the objects in the program even if you know they're not meant to do anything. Check that the program behaves sensibly when you try to save to a disc which has insufficient free space, or when attempting to load a file that doesn't exist (the program might show a friendly "That file does not exist, do you want to create it?" message).

All that is not very good, however, if the programmer only gets messages like, "I tried the program out and it crashes sometimes." Or, "The buttons don't work properly when you press them." Instead say something like, "While using the word processor on an Hades 040 machine under MultiTOS, I selected the "Save" menu option while no document was loaded, and the program crashed with 7 bomb icons on the screen. The failure is consistent and can be reproduced by selecting the "Save" menu option with no document open." Or "After clicking on the "Calculate" button in the "Math" dialog box, the button flickers but nothing else happens, regardless of the equations entered into the editable field."

Whenever you notice an inconsistency in the operation of the program, note the complete circumstances surrounding the event, and the exact details of the problem. Check whether the problem can be reproduced or is intermittant, and explain exactly how the problem can be reproduced, or if intermittant, attempt to determine under what situations the problem occurs. If you're using MiNT, note all the crash info shown after a crash, since that helps the programmer to track problem the problem down.

Also, in the case of inconsistencies in the operation of the software, try making changes to see whether the problem can be avoided. For example if a program crashes while you're using it under the Geneva AES, try using the program under the Atari AES and see whether the problem goes away.

Well, in any case I think programmers are pleased to receive the valuable assistance of the beta testers, even if none of them are what could be called "a perfect beta tester." So above all, don't get too bogged down in the details, and just get on with trying the software out. That's the most important thing.

Hi, thanks for your answer but i want a system call and not a poke adress
but perhaps the function don't exist....

Thanks

Rohan Langley a ̂crit:

thanks Katherine. that is pretty much what I try to do, with the
addition of Profile2.2 info. Is that info of any use to you?
what about a program like Sha'uri by Boyanique(sp?)

Hi folks!

I want to program a sequencer in C, but I don't know how to handle the interrupt routines. How do I interrupt the program to increase the pulse-per-quarter counter every ppq msecs? Please try to explain easily.

Thanx,

Yod 2042

Hi all! Please help me.i have to wrirte a pseudocode but dunno how to.
pls help me.i will give u the qn.

problem:

Jackpot is a popular game in Genting.We want to simulate the jackpot machine on the computer by writing a computer program in pseudocode.The program must simulate the jackpot machine by:

1) Using numbers instead of pics.(no.s range from 0-9.)
2) maintaining a certain amount of money(20 cent denominations) at the

start.Assume $200.
3) Allowing the player to simulate the insertion of 20 cent coins b4 the lever can be pulled.
4) Allowing the player to simulate the pulling of the lever.
5) Simulating the dispensing of coins when theplayer wins.
6) maintaining the amount of coins on the machine.

PART 1:
Write the decision making statements that determine if a player wins.The following are illustrated examples of the rules.

0 0 0 jackpot! (wins all in machine)

2 2 2 all values are same.(wins 50% of amt in machine.)

1 2 3 any consecutive upward sequence.(10% of amt in machine.)

6 5 4 Any consecutive downward sequence(wins 10% of amt in machine.)

2 4 6 Even no. upward or downward sequence (wins 15% of the amt left in the machine)

1 3 5 odd no. upward or downward sequence (wins 15% of the amt left in the machine)

complete the following:

a)Hierachy chart
b)pesudocode.

*hint:: in pseudocode, use the following statement to mean the generation of a random no. between 0 t0 9 that represents one of the three no.s required for the jackpot machine.

number = generate (0-9)

>Hi all! Please help me.i have to wrirte a pseudocode but dunno how to.
>pls help me.i will give u the qn.

In pseudocode, you outline how you're going to write the program,
but you describe the steps (pseudo-code), rather than actually
write the program.

So, for example, pseudo-code for describing how a program would
connect to a mail server to send a message would be something
like:

```
   Connect to server
   if connection_error then goto handle_error
   send server "HELO" command
```

```
   if connection_error then goto handle_error
  ...

handle_error:
   display error dialog
   goto exit
```

See what I mean? Just describe the steps, but don't write the code.

The interrupt handler for Xbtimer has to be written (at least
partially) in assembler, since it must preserve ALL the registers
(Pure C preserves A2-A7 & D3-D7) and must terminate with an RTE
instruction (not implemented in C).

```
SUPER    ;required for RTE
XREF foo ;C function
XDEF vector   ;interupt handler (shell)

vector:
```

```
    movem.l   A0-A1/D0-D2,-(A7)   ;save registers
    jsr  foo  ;Pure C function
    movem.l   (A7)+,A0-A1/D0-D2   ;restore registers
    rte
```

Also, remember to define the variables which can be changed by the
interupt to be volatile.

Hi everybody,
here a list of my atari productions :

Programs

#1
Author: Dominique B[illegible]r[illegible]ziat
Title: Notes
Target: All TOS compatible system
Type: Little utilitie to create notices
     on your desktop. An AV-desktop is
     highly recommanded.
Language: Fr/Eng
WIP: vers 2.11

WEB: http://www-air.inria.fr/~bereziat/windom.html

#2
Author: Dominique Brziat
Title: Magic Setup
Target: All TOS compatible system
Type: A graphical shell to setup easily
  your MagiC file configuration (compatible MagiC6).
Language: Fr/Eng
WIP: vers 1.31
WEB: http://www-air.inria.fr/~bereziat/windom.html

#3
Author: Dominique Brziat
Title: Awele
Target: All TOS compatible system
Type: An african game with GEM interface
Language: Fr/Eng
WIP: vers 1.01
WEB: http://www-air.inria.fr/~bereziat/windom.html

#4
Author: Dominique Brziat
Title: SGscan
Target: All TOS compatible system
Type: A ttp utilities t create a ST-Guide image of
  your drive (or folder).
Language: Fr/Eng
WIP: vers 1.1a
WEB: http://www-air.inria.fr/~bereziat/windom.html

#5
Author: Dominique Brziat
Title: Group
Target: All TOS compatible system
Type: A small utilitie to manage group objects as
  Thing with a AV-desktop (including MagXdesk)
Type: All TOS compatible system
Language: Fr
WIP: vers 1.00
WEB: http://www-air.inria.fr/~bereziat/windom.html

#6
Author: Dominique Brziat
Title: Excellent!
Target: All multitasking TOS compatible system (*)
Type: An universal text viewer with an emacs-like
  interface, plug-in modules, programmable
  interface.
Language: Eng
WIP: vers 1.2R2
WEB: http://www-air.inria.fr/~bereziat/windom.html

(*): MagiC, MagicMac, Naes, MultiTOS, Geneva
     problem with plain TOS due to dynamical libs

Developpement tools

#7
Author: Dominique B►r►ziat
Title: WinDom
Target: All TOS compatible
Type: A GEM/TOS Pure C library.
     Previous software are created with this
     library. Sources and complete documentation
     with tutorial avalaible.
Language: Fr
WIP: version 1 (May 98)
WEB: http://www-air.inria.fr/~bereziat/windom.html

#8
Author: Dominique B►r►ziat
Title: WinVdi
Target: All TOS compatible
Type: A Vdi Pure C library to perform vdi call
     into windows. Use WinDom environment.

Finally NOS.046 is ready ! I am going to put it on:

ftp.interware.it/users/mike/pub
or go to:
www.interware.it/users/mike
and look for the "public download directory" at the beginning of the page.

You can also request the file at my BBS, +39-40-768412 fidonet+nest
 2:333/608@fidonet.org
 90:700/104@nest.ftn

I can also send you the files by email, tell me what version you need.

nos046.lzh is the 68000 binary+readme
nos04630.lzh is the 68030 binary+readme
nos046_s.lzh is the sources archive

- I added the ability for nntpcli to try GROUP and STAT commands after a failure occurs with the NEWNEWS command, provided that NN_USESTAT was #define'd at compile time. It seems that NEWNEWS is disabled by some Internet Service Providers (ISPs), who think it adds overhead to their NNTP server, and who reason that NEWNEWS is not needed by a news client. Nos can now use typical news client commands to recover from a newnews error, BUT the news groups must be explicitly named, that is, the names must not contain a '*' or '!'. The article numbers for each host and newsgroup are stored in a new file, named "<area>.rc", kept in the same directory as the associated . I modified nntp_job() in nntpcli.c and added statnew().

- I finally included the pop3 mail client, it works as in standard nos doc, try "help popmail" to know more or read here, note that 'pop' command and 'pop2' protocol are not implemented in Atari NOS (do you need them?):

=======
popmail
=======

[N.B. This is different from the 'pop' command].

The Post Office Protocols (POP2 and POP3), are mail protocols designed for use in networks containing hosts that are normally turned off when they are not in use. In this environment it is not possible for an SMTP mail server to deliver mail to these hosts because they are not always available.

The solution to this problem is to designate a mailbox server that is available to the network at all times and can accept SMTP mail for other hosts. When a host comes on-line it uses POP to access the mail in its mailbox(es) on the mailbox server.

The advantage of using a POP server at an area mail gateway is that when mail arrives at the gateway for a station that may not be available, the gateway does not have to waste time trying to establish a connection with that station. Instead it accepts the mail and places it in the addressee's mailbox, just as if the addressee were a normal user on the gateway system (that is, this is the same thing that is done with AX.25 BBSs).

As POP2 and POP3 are different and incompatible protocols, both the POP2 and POP3 servers should be started, to handle all POP requests from clients.

The POP server requires one data file called /popusers.

The POP protocols are very simple, with minimal error handling.

When an error is encountered, an error message is generated and then the connection is terminated. You then have to re-establish a connection to continue.

---

popmail addserver <host> [<seconds>] [<hh:mm-hh:mm>] <protocol>
<mailbox> <username> <password>

Add <host> as a pop server. When <seconds> is given, a timer is started to query the host with that interval for mail.

If not specified no quering to the pop host will be started. You have to do that manually with a 'kick'.

When <hh:mm-hh:mm> is given then only in that exact timeframe are queries to the host made (allowed).

Protocol is either POP2 or POP3, depending on the mail service the host is providing. Note: pop2 is superceded by pop3.

<mailbox> is the mailbox name on the host from which mail has to be picked up.

<username> and <password> are this system's validation parameters for the host (in /popusers).

Note that on entering this command the host name is looked up. If non existent an error message is presented.

>> Example: (all on one line):

```
popmail addserver ns9bob 1800 00:00-03:00 pop3 ns9liz ns9liz
                                                      lizpasswd
```

---

popmail dropserver <host>

Drop host from the list of pop servers to be queried. All references to the entry are deleted from the current system.

>> Example: popmail dropserver ns9bob

---

popmail kick

Kick the local POP client, to get mail from the server. This command is needed when no interval is specified with the 'popmail addserver' command.

```
_________________________________________________________________
popmail list
_________________________________________________________________
List the current popmail server table.

_________________________________________________________________
popmail quiet [on|off]                                Default: off
_________________________________________________________________
Display or set the POP quiet flag.

This flag determines whether the bell sounds when the system
announces that incoming mail has arrived.  When quiet is set to
'off' you hear the bell.

>> Example:  pop quiet on

_________________________________________________________________
popmail trace [<level>]
_________________________________________________________________
Display or set the trace level of POP sessions.

<level> = 0:  no trace
          1:  serious errors reported
          2:  transient errors reported
          3:  session progress reported

All trace output goes to the session log file.

* ----------------------------------------------------------------
* # Example of setup for the POP3 mail client
* popmail addserver 151.99.226.3 POP3 mike mike mikepw
* #popmail quiet on
* fkey 62 "pop kick 151.99.226.3\n"
* ----------------------------------------------------------------
```

- Enhanced Help function. Now you can use '?' as before to list available commands and help <command> <subcommand> as long as you put *.HLP files in the help directory, same sintax as ftp.hlp, I am giving some starting help files with 0.46, how do want to complete the job ?

- I also modified few things like the fkey command, to catch the correct keys from the Atari keyboard, please check how it works.

- Please send me your impressions and requests, maybe I will be able to go on with the project if enough people is interested.

Join the NOS mailing list sending an email to net2net@bbsgate.interware.it with subject: "SUBSCRIBE NOS".

Hi!

Can anyone give me an introduction in programming interrupts in (Pure) C on my Atari ST? I want to program a sequencer, so the main program should be interrupted to increase the pulse-per-quarter-counter in certain intervals depending on the bpms. Please try to explain easily for I had a break in programming for a few years.

Please mail and not post!

Newsgroups: comp.sys.atari.programmer

```
#include <stdio.h>
#include <tos.h>

int main(argc, argv)
int argc;
char **argv;
{
    DTA d;
    int r=0;
    Fsetdta(&d);
    if (!Fsfirst(argv[1], FA_SUBDIR))
    do{
        if (d.d_attrib!=FA_SUBDIR)
        {
            r++;
        }
    }while(!Fsnext());

    return r;
}
```

This simple program returns the number of files matching the wildcard passed as argument (parameter) in the current directory, I just need to adapt it for the VFAT environment.

Could you please suggest how to make it work with MagiC ? I tryed:

```
#include <mintbind.h>
#include <tos.h>
#include "magx.h"
#include "mgx_xfs.h"

void main()
{
//   Pdomain( PDOM_TOS      /* 0 */ );
     Pdomain( PDOM_MINT /* 1 */ );
```

```
{
     XATTR xattr;
     LONG dirhandle;
     LONG err,xr;

     dirhandle = Dopendir(".", DOPEN_NORMAL  /* 0 */  );
     if   (dirhandle >= 0)
     {
          BYTE buf[128]="pippo";
          do   {
               err = Dreaddir(128, dirhandle, buf);
//             err = Dxreaddir(sizeof(buf), dirhandle, buf,
//                      &xattr, &xr);
               printf("%s\n",buf);
//             if   (xr)
//                  printf(".. Fehler bei Fxattr ..\n");
               if   (err)
                    printf(".. Fehler bei Dreaddir ..\n");
               }
          while(!err);
          Dclosedir(dirhandle);
     }
}
}
```

But does not work, a strange string is printed for each file and Dxreaddir is not available in my binding.

Can anybody help me to know what is the rigth binding for Dxreaddir ?
Is there any MagX library I can use with Lattice C ?

Oh nonsense! The doofus spammed every programming newsgroup this side of
McMurdo Sound with an obvious solicitation for us to do his homework for
him. I don't care whether he loses his computer account; I think he should
be slapped around a little.

I think you took that a bit far. Normally x-posters are new to the web
and have not yet learnt web etiquette. When I first came to the web I
know that I did a bit of x-posting myself. I think the author was
obviously trying to post a relevant question. Maybe it would have been
better to direct him to a place where his question would be more
relevant, or recommend web sites that are on pseudo code. I would do
the same but I know nothing about pseudo code. It would have at least
been better to write to the author and tell him that you think the post
was inappropriate. If the problem persisted then perhaps you could talk
to his post master.

1) It was probably against his college/school rules, which could result
in suspension or expulsion.

2) This is not the web. This has nothing to do with web etiquette.

I am sorry, but I do not agree with you. The original question may
well have been a mistake, and it might even have been someone's
homework.

It is okay for those of you who live in cloud-perfect-land to
criticise the actions of others, but just because you know what
"netiquette" is does not mean, and cannot mean, that everyone else is
so aware. Cripes, we all make mistakes don't we?

If you do not like something, it is simple to ignore it and move on to
the next message. Since when were you voted in to be everyone's
spokesperson on these newsgroups anyway?

Andrew

Hi everybody !

It is possible to access to a window which is not topped ? I want to
say, clic on button, object...on a window which isn't on top ?

Thanks.

(Excuse me for my poor English...)

Very likely, given the style in which it was posted. Especially telling is how the problem statement was well edited, and the surrounding text a mishmash. This is a sign of copy and paste, to me.

>It is okay for those of you who live in cloud-perfect-land to
>criticise the actions of others, but just because you know what
>"netiquette" is does not mean, and cannot mean, that everyone else is
>so aware. Cripes, we all make mistakes don't we?

Yep, and when we do, the downside varies according to the magnitude of the error. Had he merely posted his homework question to a single programmer group, he would not have been nailed for spam. He might still face administrative penalties at his home university, but it is not likely that posting a single message will get you nailed as a spammer.

He made a big error - posting to virtually every programming group out there. Had he been let off with a warning that did not inconvenience him, he would have felt no real need to avoid it in the future. Nor would the people reading the group who saw the technique and the results.

Now, a large group of people watching may be a little less quick to post. That has negatives, but it does mean that the group stays civilized for a bit longer. After watching sci.physics.relativity fall from a useful group in which begineers and experts could share ideas to a ceaseless pit of noise, I am not eager to see the programmer groups vanish under the load of the freshman class.

Back when I started with news, I made errors too. I did not, though, cross the major lines. At that point, the big bugaboo was posting commercial ads in inappropriate groups. I was careful partially because I knew of people at my own college who had lost net access because of it. I knew that there were penalties, so I read the rules of usage. Amazingly enough, I even read newsgroups before posting, simply because posting boneheaded posts such that the administrators got complaints could lose you access, and they made sure we knew it.

It is now so easy to get access that losing an account is virtually irrelevant. Get a modem, hook up to dejanews, and you are back in business.

>If you do not like something, it is simple to ignore it and move on to
>the next message. Since when were you voted in to be everyone's
>spokesperson on these newsgroups anyway?

If we do not enforce at least minimal rules, then this becomes complete anarchy. Again, before assuming that I am asking for a net cop, go look at sci.physics.relativity. Look for the content, and look for the kooks. Scary, and it can happen in any newsgroup if the group does not police itself.

comp.sys.mac.programmer.codewarrior has been better than most in that regard. There are groups (comp.lang.java.programmer springs to mind) where moderation better happen soon, else the group is going to be virtually devoid of content. Spammers do hurt, in that they dilute content.

use:
~WIND_SET(win_handle%,24,1,0,0,0) with GFA
or
wind_get(handle,WF_BEVENT,1) with C

Be carefull with editables objets and the redraws after this
function. To go back to old window managment, use 0 instead of 1.

Cheers.

use this after opening of a window

```
#define WF_BEVENT        24
wind_set(handle,WF_BEVENT,0x0001,0,0,0);
```

After this the window is not topped when you click in a object
on a window which isn't on top .
This only works on AES versions supporting this (4.0 or better)

It was his postmaster that decided to kick him off not me. I merely
complained about the spamming and will do the same if others post
innappropriate messages repeatedly. The fact that the guy x-posted to
a dozen groups is not offensive in itself but served to compound the
problem in this case. Just think what Usenet would be like if every
newbie behaved like this guy, how would you feel about writing to
dozens of jerks per day telling them that their posts were
innappropriate? I think it is the responsibility of the author to obey
netiquette, 99% of people can figure it out so why shouldn't the
spammers? Incidentally, did you take the time to write to this guy? If
you did not then I think you have a bit of a cheek telling me I took
things too far, at least I took the time to make sure this guy doesn't
spam again.

Found the problem (after long testing), you have to skip the first 4 bytes of the string returned by Dreaddir or Dxreaddir, I think this is what the following means:

---

fnamebuf enth⌂lt dabei in den ersten 4 Bytes die Inode-Nummer, die man normalerweise nicht braucht (Fehldesign von Dxreaddir) und die in der XATTR-Struktur sowieso nochmal drinsteht.

But please tell me want is the meaning of this:

Nach Dateitypmustern wie "*.prg" kann dabei nicht gesucht werden, stattessen mu⌂ man selbst auf regul⌂re Ausdr⌂cke abtesten.

Btw I post here the example program I have done and that works with Lattice, after correcting mintbind.h and osbind.h (this was also tricky) !!

```
#include <mintbind.h>
#include <tos.h>
#include "magx.h"
#include "mgx_xfs.h"

void main()
{
//   Pdomain( PDOM_TOS      /* 0 */ );
     Pdomain( PDOM_MINT /* 1 */ );
{
     XATTR xattr;
     long dirhandle;
     LONG err,xr;

     dirhandle = Dopendir(".", DOPEN_NORMAL  /* 0 */  );
     if   (dirhandle >= 0)
     {
          char buf[128];
          do   {
//            err = Dreaddir(128, dirhandle, buf);      <-- you can also try this
              err = Dxreaddir(128, dirhandle, buf, &xattr, &xr);
              if   (xr)
                   printf(".. Fehler bei Fxattr: %d ..\n",xr);
              if   (err)
              {
                   if(err!=-49) /* if not end of reading */ //<-- found this by
test
                        printf(".. Fehler bei Dreaddir: %ld ..\n",err);
              }
              else
              {
```

```
                    printf("%s,%u\n",&buf[4],xattr.attr);
//In the following comment lines is how I found the problem
//                  printf("***%c%c%c%c***\n",buf[0],buf[1],buf[2],buf[3]);
//                  printf("%u,%u,%u,%u,%u,%u,%u,%u,%u,%u\n",
//                           buf[0],buf[1],buf[2],buf[3],buf[4],
//                           buf[5],buf[6],buf[7],buf[8],buf[9]);
//                  printf("%lu %lu %lu\n",buf,xattr,xr);
                    if   ((xattr.mode & S_IFMT) == S_IFLNK)
                    {
                         XATTR xa2;

//                       printf("SymLink found %s,%u\n",&buf[4],xattr.attr);
                         err = Fxattr(0, &buf[4], &xa2);
                         if   (!err)
                              xattr = xa2;
                         printf("SymLink dereferenced %s,%u\n",&buf[4],xattr.attr);
                         err = 0;
                    }
               }
          }while(!err);
          Dclosedir(dirhandle);
     }
}
}
```

wind_set(handle,WF_BEVENT,1,0,0,0);

where WF_BFEVENT = 24

This only works under AES 4.x and equivilent, or where indicated by
appl_getinfo() (mode 11, where bit 5 of ap_gout1 is set).

Anthony

Hi!

centek <centek@graphity.fr> wrote:
> Unfortunately, the Thing documetation only says how to install the
> font-selector,

Well, the German docs /do/ have docs on the font protocol itself, and I actually doubt Joe Connor left them out when translating the hypertext.

But as it's a bit difficult to find them directly, here's how to get there:

From the main screen, go to 'Protocols', then to 'Font protocol' (the names in the translation may differ). From here, use the Forward- and Backward-Buttons of ST-Guide to navigate to the description of the messages used for the Font protocol.

As you might see now, I didn't make a mistake, the docs are there.

Ciao

Thomas

P.S.: ST-Guide has a "Search" function ...

Okay, I think we've beaten this topic around enough. It's good to meet our
neighbors, though (Hi Apple II programmers! ^_^) but I think we can lay this
one to rest.

One last thing though... Isn't it kinda interesting that the Windows
programming groups were strangely left out? Kinda makes you wonder. Maybe
the kid wasn't a lost hope after all? ^_-

Russ,

The DRI .o format used on the Atari ST is the same as that used on
CP/M 68K. If you go to the Unofficial CP/M Web page at

http://cdl.uta.edu/cpm

or the mirror at

http://www.mathcs.emory.edu/~cfs/cpm

you can download the CP/M 68K Programmers Reference Guide which
details this.

DRI defined several output formats for the executable, the main
ones being

CP/M 68K contigious format relocatable and absolute, magic number 601A
GEMDOS contigious format relocatable, magic number 601A
CP/M 68K noncontigious format relocatable and absolute, magic number 601B
CDOS 68K crunched relocatable, magic number 601C

The CP/M 601A relocatable format uses one word of relocation information
for each word of code and data in the program and so produces a file which
is very big. The GEMDOS 601A uses a more compact relocation information
the following is a description of the GEMDOS 601A format from the GEMDOS
manual in the ICATARI user group magazine issue 3.

An executable file consists of a header followed by

images for the text and data segments, zero or more symbol
table entries, a fixup offset, and zero or more fixup
records:

Executable File Parts

```
 ___________________
|    file header   |
|__________________|
|                  |
|   text segment   |
|                  |
|__________________|
|   data segment   |
|__________________|
|      symbols     |
|                  |
|__________________|
| fixup information|
|__________________|
```

The file header contains a "magic" number (a signature to indicate that it is an executable file) and several long-words containing size information:

Executable File Header

Offset	Size	Description
0x00	word	0x601A (magic number)
0x02	long	Size of text segment
0x06	long	Size of data segment
0x0A	long	Size of BSS segment
0x0E	long	Size of symbol table
0x12	long	(reserved)
0x16	long	(reserved)
0x1A	long	(reserved)
0x1E		(start of text segment)

The text and data segment images immediately follow the header. The symbol table, if there is one, follows the data segment.

GEMDOS will "fix up" a longword in the text or data segments by adding the base of the text segment to the value already in the longword. The fixup list specifies which longwords need to be relocated. The first item in the fixup list is a longword specifying the offset of the first fixup;

the longword is NULL (0L) if there are no fixups. Single bytes following the longword specify offsets to more fixups. The longwords _.m_.u_.s_.t start on word boundaries, or the system will crash.

Relocation Bytes

Byte	Description
0	end of relocation information
1	advance 254 bytes, get next byte
2, 4, .. 254	fixup longword at location pointer
3, 5, .. 255	(odd numbers, reserved for future use)

Symbol Table

The symbol table consists of symbol-table entries, formatted as:

Symbol Table Entry

```
 ___________________
|                   |
|                   |
|      8 bytes      |
|    symbol name    |
|___________________|
| WORD symbol type  |
|___________________|
| LONG symbol value |
|                   |
|___________________|
```

Values for Symbol Types

Type	Value
defined	0x8000
equated	0x4000
global	0x2000
equated register	0x1000
external reference	0x0800
data based relocatable	0x0400
text based relocatable	0x0200
BSS based relocatable	0x0100

The Sozobon system extends the symbol table types as described in the documents thet come with it.

The Sozobon linker outputs the GEMDOS format executables only and does not understand 16 bit relocation information or PC relative fixups, it assumes all address references are 32 bit. This is ok for the output from

the Sozobon compiler but is not so good for handeling hand coded assembly files.

I am currently (very sloooowly) working on a modified version of the Sozobon
tools to allow me to use them as a cross development platform for the PC to let me build a working CP/M 68K system when I eventually get some hardware to run it on.

I currently have the linker modified to handle GEMDOS and CP/M 68K 601A format output files, to handle 16 bit address references, PC relative fixups
and to fix one or 2 bugs in the linker.

I plan to add support for 601B and 601C format files and absolute files next.
After that I plan to look at JAS and expand that a bit.

If you want the new linker or need any more info on the DRI 68K file formats
drop me an email to: peter at cylon dot ie.

Regards,
Peter Mc Shane

Errrm, scanner support doesn't seem to me to be something you should put in the OS -- well, not on any non-Windows anyway... :)
The PARX modules are a better idea, as only programs that want to and know how to use them will load the scanner interface code (pity DLL support still isn't much on Atari... -- That would be a worthwile OS addition, preferably using the same API as one of the existing DLL managers)

Subject: vr_trnmf() problems. (4-bit to 16-bit forms conv)
Date: 1998/07/28
Message-ID: <6pkd38fde1@o.online.no>#1/1
X-Deja-AN: 375626292
Organization: Assem-Soft
Newsgroups: comp.sys.atari.programmer

Hi, all. I'm trying to write my own rsrc_load() function. This routine is nearly done, except from one thing, which is what I'm asking for help about now. Right now I'm doing the 4 plane forms (color icons) to 16 plane froms. And this is where I need some help.

My problems are those; When I, after converted the icon data from 4 to 16 plane device indipendant format, use vr_trnmf() to transform this into device

indipendant format, it works as it should on the Falcon (Videl, standard 16-bit motorola format, rrrrrggg,gggbbbbb). But, vr_trnmf() don't seem to work with my Crazy Dots 15-bit gfx card (which is 16-plane intel format, gggbbbbb,0rrrrrggg, where bit 0 is not used). Does this mean that vr_trnfm() don't work correctly with byte-swapped gfx modes, like the Crazy Dots?

I then did the transformation to device dependant myself, and this worked exactly as it should, so I KNOW that this problem is within the vr_trnsfm() funtion. I've been trying to read some C sources to see how they do it, and it seems to me that they are actually doing the device independant -> device dependant transformation manually, after checking what the device dependant format looks like. Now, that leads us to my question..

How do I check in a reliable way what format (byte swappted or standard motorola, 15 or 16 bit) I should use?? Any help on this matter is most appreciated.

I am still working on my "Toolbox" DLL engine. (started mid-1992)

It was written in 68k assembly language.

It uses 32k of RAM, runs on TOS 1.0 STs through TTs. (Falcons? Hades?)

A 68000-family CPU is required.

Libraries can be bootloaded, or loaded as needed by applications.

It supports System and User libraries.

There is support for library enumeration and interrogation.

Each library can be used by more than one application.

It can be called from the foreground application via a TRAP. Or, if you
must it can be called via a jumptable.

(Ideally, it would have been ready for public release this week, or early
next week)

Still to do: user and programmer manuals.

the Jaguar. This couple of programs permit to upload a jaguar program and performs somes operations with the kernel. Currently my kernel allows dump memory, read/write serial eeprom, upload program, handles 68000 exceptions, and big memory transfer between ST and Jag and provides about 25 systems calls.

Me (Rodolphe Pineau) and a friend (Eric Gaudet) are working on the
adaptation of a paralelle pocket ethernet adaptator from PC World to the
Falcon. For the momment, we could read and write adaptator's registers
and read the EEProm to get the hardware adresse.
We hope to code the readpacket and write packet routine next week the
release a beta of the MiNT Net driver.

Salut rodolphe.

Me and some friends (the CloeTeam) are working on the Version two of our 3d modeler/renderer :Cloe2.
For the instant we are only working on the pc version but i want to make the Atari version like the first version of CLOE.

But we need hands. This version of Cloe will be much much powerful than the first version and it will be freeware, but we don't have the time to make the Atari conversion. It's not so much work because it's only minor modification on our windows system. The code of Cloe is OS independant for the user interface. There is a little work to do for the plugin system.
Note i think that for compatibility between vdi we need to use Nvdi because we use much more off-screen than the first version. In the first version this part of code was write in ASM but whith the new graphics mode for the Hades and the other Atari clone ot was not good. So i want pure gem/nvdi coe now.

Waiting for hands.

Cool! What kind of ethernet-adapter do you adapt? Hopefully it's
something that's easier to find than the DE600 ;-) It looks like I'm
going to get a Milan this year, so a ethernet-solution for my Falcon
is something I really need.

Hi !!

I am looking for the object file formats for the different compilers on
the ATARI computers.

In particular, I am interested in the formats of
 PureC, PurePascal - containing the debugging info stored in the object
                     file. Is there any Profiling info stored in the
                     object file, so that PureProfiler can work with ??
 MegaMaxModula 2   - for the definition modules and the implementation
                     modules, also containing debug info, if applicable.
 GNU C/C++/ObjC   - Also need "full details" about the object files.

Any other object file formats are also greatly appreciated.
I am currently writing kind of a ReAssembler, so I need to know anything
that is available about all the object file formats available on the
ATARIs. Is the *.LOD file's format for the Falcon DSP modules anywhere
documented, or do I have to ReAssemble the Falcon ROMs to get the info I
need about ?

We're using all ethernet adapter based on th RTL8012 from Realtek. Most of
actual adapter are based on this chip (exept the DE620 and the Xircom
ones).After this one we shurely have a look to the DE620 from DLink witch
replace the DE600. We ask Dlink for documentation but they don't aswer :-((
We'll use Linux source code for the DE620 (wheras we've got data sheet for the
RTL8012 and Linux sources :-)))

You open the database file.
Click on Query.
You can then either search for free text or you can use the Expression
to fill in a dialogue box with a complex expression for the search
criteria. This is of the form:

<Field Name> <operator> <Expression>

where <Fieldname> is selected from the displayed list
<operator> (= , >, < etc)
<Expression> is built from the list of functions in the scroll box.

Expressions tend to look like expressions in Basic.

This is the plain old a.out format. See man a.out on any BSD derived
system (eg. Sun3/Sun4).

Hi,

Is there someone who can give me correct date/place/address of the ORNETA 98
party.

We have heard that it will take place at 7/8/9 August. But we don't have any

address.

PLEASE REPLY IMMEDIATLY!! Because we have to arrange a vacation and have to travel for 2 days to get there.....

What I meant, of course was, a *non-vfat* partition. If I have a
non-vfat partition under MagiC, Dcreate() will fail with long names.
But in that case I want it to work as under single TOS. I could do
this by setting Pdomain(0) temporarily. But for that I have to know
what file system the partition has.

I haven't been following this thread in too much detail, but are you
not looking for the call val=Dpathconf(DP_TRUNC); which enquires whether
the filename will be truncated automatically or not?

```
val = 0 (DP_NOTRUNC):   No truncation performed. Invalid filanames cause
                        ERANGE (-64) errors to be returned.
val = 1 (DP_AUTOTRUNC): Filenames are automatically truncated to max length.
val = 2 (DP_DOSTRUNC):  Filenames are truncated to DOS 8.3 format
```

(what is the difference between DP_AUTOTRUNC and DP_DOSTRUNC, as this
 is surely just a specific case of DP_AUTOTRUNC?)

Note that I haven't been following too closely the recent changes to
MiNT's TOSfs, but I guess this is still valid (info taken from compendium).

Also, this talks about filenames, rather than directories... perhaps this is
not respected in Dcreate()? (if so, is this an omission/bug?)

Anthony

Yes, that is probably exactly what I was looking for. Never thought
of Dpathconf()! :) In any case, it returns 2 on a non-vfat partition.

>(what is the difference between DP_AUTOTRUNC and DP_DOSTRUNC, as this
> is surely just a specific case of DP_AUTOTRUNC?)

Yes, of course DP_DOSTRUNC is a special case of DP_AUTOTRUNC, but it
works differently, and it's good to know that, because you might have
(several) dots in your file or directory name.

>Also, this talks about filenames, rather than directories... perhaps this is
>not respected in Dcreate()? (if so, is this an omission/bug?)

The funny thing is, it doesn't work with Dcreate(), i.e. Dcreate

returns an error code if the name is too long and Pdomain() is set to
1. It works properly with Pdomain(0). In any case, that is the outcome
of my (brief) testing, but I might be missing something.

I'll do some further testing.

Well, I must certainly correct this. I don't know what happened the
first time I tested it, but it must have been something else that made
Dcreate return an error code, because now it works as it should, i.e.
long names are automatically truncated on non-vfat partitions, whether
they be directories or files, and the directories/files are properly
created with shortened names.

Hi there

can anyone tell me how i can get my scsi cdrom (known to work fully) to work connected to my falcon.

It shows up on ahdi's initialisation but that's it. metados doesnt even work

it just gives me a drive icon that opens a window with nothing in it, the drive doesnt even read when i do refresh.

i am using hte iso9660f drivers.

any help would be appreciated.

yours

Ian Norton

Such a driver would rule, esp. if someone can get it to communicate
through TCP/IP or Windoze Networking, to communicate with PCs!

That'll be cool!

I've never had much luck with MetaDOS, especially on a Falcon (and only
marginal luck on a Mega STe). I'd advise buying Extendos, which has
worked great on my Falcon and STe.

If serial will do then my suggestion is that you use a nullmodem cable and the Z-modem transferprotocol, this is what I use myself with satisfaction. And it's free.

For the Falcon you need a comm's program or at least a good implementation of the Zmod. prot., there's some available as shareware and freeware. On the PC you can download Omen Technologies (the inventors of Zmod. prot) version from their homepage (search for it), I have chosen to use the "classic" setup since it really works. Just do a couple of switches and the setup is complete. Around 11Kb/second (660Kb/minute) with good errorchecking and "crash recovery", i.e. you can continue to send on "half sent" files. You can even unplug and replug the nullmodem during transfer and it will still work 100%.

Send a mail if you're intrested in more details.

Regards, K.Hampf

I don't know if that might be possible. I mean communicate through the
win network. Guess you'll need some sources from M$ for that... To make
a connection from a PC to the atari (using win network) can be possible
if someone would port the samba server from Linux to Mint...

You should try Spin which is more efficient than metados and able to do DDS (if you drive can).
i suggest you to have a look at:

http://www.muenster.de/~reschke/soft_e.html

i use it on my Falcon (AB040+Magic) with a sony and it work very well....but no DDS
cause i have unkow problems with my drive...

Sure, there are the "Atari compendium" from scott sanders, in english
and a very good reference.

I know in french a old book from Micro-application "Atari's developper"
from a German edition, but i don't if it does exist in english.

Atari compendium can be found as a CD-Rom in PDF, html format.

Another correction, a final one this time, I hope. :)

After extensive testing, I must conclude that it remains a serious
problem. Under MagiC, creating one directory on a non-vfat (i.e.
(DT)OS) drive is no problem. Problems occur if you want to create a
directory tree. If C is a (DT)OS directory, then

```
  Dcreate("C:\LONGDIRECTORYNAME");
```

creates the directory "C:\LONGDIRE".

If you then try to create directory "C:\LONGDIRECTORYNAME\ANYNAME",
however, it fails. This works correctly under plain TOS and setting
Pdomain(0) doesn't help either.

I can only conclude that this is a bug in MagiC. If a directory is a
TOS directory, Dcreate() c.s. should behave as under plain TOS.

Moreover, if I have a file "C:\LONGDIRE\FILE.EXT", a call of
fopen("C:\LONGDIRECTORYNAME\FILE.EXT","MODE") fails under MagiC on a
non-vfat partition, but works correctly under plain TOS.

Has anyone else encountered these problems? Are there perhaps standard
workarounds to overcome it?

Thanks for any feedback.

I don't know about any standard solution/workaround, but it might be an
idea to do the truncation yourself. At least that way you know that it's
going to work on non-vfat/vfat partitions. It may not be the best way
of doing things, but if it gets the desired results...

As others have said, the "Compendium" is the book to get hold of.

Also, you will need a piece of software called a "resource editor".
This creates the .RSC files which contain the visual elements of a Gem
program. It allows you to design the user interface and allows you to
give names to the elements of the resource file that your source code
needs to manipulate.

It is *possible* to create a resource file manually but it is very
very difficult to get right, so I don't recommend doing it this way.

The best resource editor is a commercial one called "Interface" but
(free/share)ware ones exist. Afaik most of them assume you program in
C but Interface allows you to specify other languages should this be
required. Maybe some of the others do - I dunno.

You really need a framework to write a proper event handling GEM
program with windows etc. However one that just checks for the absence
of arguments and presents the file selector with a suitable prompt is
easy enough to do. Just call appl_init() then fsel_input() then maybe
form_alert() and appl_exit() at the end.

I based my proper GEM programs on the layout of Compute!'s ST
Application Guide Programming in C, Field, Mandis & Myers. Incredibly
ancient, buggy and aimed at a version of C from the stone age. The
actual division of tasks they layout is sensible and once you have
fixed the bugs it works.

The samba-server has been ported ages ago. I can't remember where I
found it but AFAIR I still have the archive on a Zip somewhere. The
new MiNT-distribution (MiNT98) is supposed to come with samba as well.

I don't know if that code is entirelly free to get.. I started once to
search and found a few things... but I don't know if it's of use.
But I guess that must be possible with a Netware server....
But than you also have to install netware clients on the PC's...

Well it's going ahead. Online PD is a new PDL with a difference. Instead of sending money for PD you can now download it directly from the internet. The site is set out just like a PD catalogue and it has download links to the software you want. Unlike Ftp sites there is no need to wade through loads of folders to check for the software you want - cos everything has a decent description and a direct download link.

If you know of any good PD that I can include in the library then please send me the info. It must be on the internet because I don't have time to upload it anywhere.

When you send me a submission I don't mean send me the actual program. All I want is the following info.

Program Name: (IE: Llamatron)

Program Type: (IE: Game)

Machine: (IE: Is it an ST,STE, or Falcon only program?)

Emulator Compatibilty (IE: Does it work under Pacifist?)

Program Description: (IE: Llamatron is a game by Jeff Minter and a clone of Robotron. The object of the game is to shoot llamas etc...)

(Please supply a detailed description.)

Download Link: (IE: ftp://funet.fi/games/shoot/llama.zip)

This is a good way of getting your program noticed, or any other PD
programs you know of.

You're right. I'd better do that. But I balked a little at the amount
of work it'll take.

Thanks.

Yeah, good point, but hopefully it'll be backed with a decent Atari
network card. I think that the lack of PC-aware Atari networking is
killing the Atari, it certainly is in my house

Anyone help a new TT owner connecting a hard drive?

I have bought a 540MB IBM DALS-3540 SCSI hard disk and although it appears in the partition table as device 6, when I try to format it, I get a message saying that the TT does not support this drive and I need to update the WINCAP file.

Can anyone please tell me where I can get an updated version of this file?

Best regards...

Barrie Capel

Can any GFA programmers out there tell me which version of the GFA Interpreter runs on the TT in TT mode please?

I have an original V3.5E, but it will only run on the TT when the TT is in one of the ST modes.

Is the TT compatible version later than 3.5E?

Best regards...

Barrie,

3.6 is the TT compatible version.

Thaught there were a few MiNT drivers available for some ethernet
cards/adaptors. And about what I've heard there are everywhere ppl who
are developping or porting drivers and ethernet interfaces... hopefully
they will continue and will have results pretty soon...
At the moment there is no easy way to connect your atari to a
heterogenious 10baseT ethernet network. That must change.
I think it looks pretty good this time... but who am I :)

It is Belgian.... but I meant real beers, not just Stella or Jupiler ...
we have thousands of them... ...a real Belgian beer like Palm or

Rodenbach or Chimey...

Greets,

Does your SCSI interface include a real-time clock? It's often
hard-wired as device 6.

I don't know whether I can be of direct help but I have managed to connect a DSAS 3360 to my TT.

Not sure of the difference between the DSAS and the DALS (my DSAS came out of a Mac). I had to do a bit of fiddling with the jumpers, principally the ones which controlled Unit Attention and Target Initiated Synchronous Negotiation.

Have you got a data sheet on the drive? You could ring IBM on 01705-561000 to get one.

What driver are you using? Some of these modern drives require a modern driver (HDDriver or CBHD).

>Can anyone please tell me where I can get an updated version of this

Hmm ... I wouldn't know what to do with a WINCAP (wear it?!) if I had one :-)

I have the shareware GFA-compatible compiler MLINU_TRQ which is to
3.5E specs and runs fine on this m/c in TT med.

Oh, whoops, it's the interpreter which is causing trouble isn't it.
MLINU doesn't have one of these.

Hello All,

I am liquidating my studio equipment!

I have Atari ST$s, TT$s, Atari 19$ monochrome monitor, MIDI software
including Cubase Score among others, an Tascam 388 8-track reel to reel,

out board gear and MIDI instruments. I have published the list of
equipment at: http://www.cape.net/glgallery/studio.htm

Please pass this URL to any who may be interested.

Thanks, Wylie Johnson (watchman@cape.net)

I'm trying to write an animator in GFA Basic (makes Animated pictures)

I've got an idea of how to do it, but I need a short/quick way to read
co-ordinates in the file, rather than do this:

```
OPEN "I",#1,a$           ' The a$ string is the file
LINE INPUT #1,text$
IF text$="1"             ' the x co-ordinates in the file
 a=1                     ' made into a number string
ENDIF
IF text$="2"
 a=2
ENDIF
.
.
.
IF text$="300"
 a=300
ENDIF
```

And the same with the y co-ordinates

Precisely.

> This was never documented, AFAIK,

Also correct.

The $c9 opcode has been in all versions of GEM integrated in TOS, as well as NAES and MagiC. It is not present in Geneva. It is used by STinG to allow AES taskswitching while a potentially blocking STinG call is excuting. I've been able to tell that people run Geneva when they complained STinG clients would block task switching :-)

This call which people used to call _appl_yield() (as opposed to appl_yield() which is a proper AES ($c8, that is) call and which only exists in PC-GEM) is quite handy in library-like code. Reason is the following.

Library code is meant to be called by some application. If a library call needs extended time for execution, AES multitasking won't work anymore since it is cooperative multitasking, and the library code needed to relinquish the CPU to the AES regularly. The library call cannot simply call evnt_timer (0); as such a true AES call needs at least the address of the global array of the calling application to meet the binding requirements of AES. Luckily there is

_appl_yield(), it can be called inside the library code as it does not need any parameter the value of which the library won't know.

Calling it does no harm with Geneva, it just means that during execution of that blocking call multi-tasking is suspended, just like it would anyway if the call had not been called in the first place.

Cheers Peter

Still working on improving STinG. That's the main thing. Then there are a few things to fix on TelStar, the telnet client. I got a half-finished Telnet server here too, and work on an NFS client is suspended too ATM.

Cheers Peter

VAL(text$) changes the string into a number. So you just go :

```
           a=VAL(text$)
```

In the Radio Play it's mentioned just before Zaphod and Ford fall out of
the cup in the sky of a strange planet.

Then later on at the end, when Arthur nicks the Heart of Gold, Zaphod
says "Holy Belgium Man!".

Well, which drive do you have? Have you run ddstest.ttp?

That's not a question of MetaDOS. It only depends on the BOS driver,
which has to do the communication with the device.

As it has been said before, check out SPIN!
(http://www.muenster.de/~reschke/soft_e.html).

```

No, it doesn't work, I think because the line is text, and you can't
convert a normal string to a number string!

```
>
>You would probably use a different name.. but the concept is to input
```

>as a variable, no need to do it as text and convert..
>

That can't be done.

Hi Tony,

 > ANYONE ELSE!!!!!!!! :)

Author: John Richardson
Title: Breakneck
Target: All Atari computers
Type: An automated nodelist processor for fidonet technology
networks. The advantage of this software over other
offerings is that it is fully MAGIC compatible.
WIP: Beta stage is now completed. Release version is due out
shortly. This is a free product.
WEB: N/A, but the latest beta release is available from all Atari
BBS's who take the FANfiles network.

I've half written a replacement for Nodediff which also has trouble
running

under Magic. I don't know if I'll ever get around to finishing it
though, I
don't think there is enough interest.

John.

>
> VAL(text$) changes the string into a number.  So you just go :
>
>            a=VAL(text$)
```

How about using a simple loop to read and convert the co-ordinates...

```
OPEN "I",#1,file.name$ !Open the file
REPEAT                  !Start the loop
 LINE INPUT #1,X$      !Get the x-coordinate - These must read in the same
                                 order as the file
                              coordinates are saves (X
                              first, Y next)
 LINE INPUT #1,Y$      !Get the y-coordinate
```

```
 x=VAL(x$)           !Convert x coordinate to a varible
 y=VAL(y$)           !Convert y coordinate to a varible
UNITL EOF(1)           !This repeats until the end of the file is reached
```

You could also change the loop so that it ends in a particular area within the file. I.e, UNTIL y$="END" or you could use UNTIL x=0 AND y=0. This is sort of decission making but must be set to what ever tag the file uses to say "yes all coordinates are read".

Also if your file has many coordinates whay not put them in an array. Before the loop you could set the array by...

```
DIM x.crd(number.of.x.coordinates)
DIM y.crd(number.of.y.coordinates)
```

Then in the loop use and increase varible like INC loop. Here is an example of how this would work....

```
OPEN "I",#1,file.name$              !Open the file
DIM x.crd(number.of.x.coordinates)  !Set the x-coordinate array
DIM y.crd(number.of.y.coordinates)  !set the y-coordinate array
CLR loop              !Clear loop counter
REPEAT                     !Start the loop
 INC LOOP             !Increase the array counter
 LINE INPUT #1,x$          !Read the x-coordinate
 x.crd(loop)=VAL(x$)                !Store the coordiante in array
 LINE INPUT #1,y$                   !Read the y coordinate
 y.crd=VAL(y$)                     !Store the y coordnate in the array
UNTIL EOF(#1)
```

Remember the coordinates are stored in the arrays starting and number 1 not 0. These line inputs must again be placed to read in the same order as the coordinates were saved to the ani file.

The coordinates could then be read with a simple loop like this...

```
CLR y.loop                            !Clear the y loop read varible
FOR loop=1 TO number.of.x.coordinates  !Loop for all x coordinates
 x=x.crd(loop)                        !reads the x coordinate from array
 INC y.loop                   !Increase y array counter
 IF y.loop<number.y.coordinates        !Make sure not reading beyond array
  y=y.crd(y.loop)                      !Read y coordinate from array
 ENDIF
NEXT loop                !Loop back if not all read
```

Remember the loop varible must be set according to the largest amount of coordinates. I.e if there are a less number.of.x.coordinates than the y coordinates, then loop should equale number.of.y.coordinates and INC y.loop should change to INC x.loop.

Well hope this helps and is not over explained...

Scott.

Hi again everyone...

Thanks for all the help on the fats table. I went to all the suggest net sites and printed off the disk structures and stuff. However, I'm still stuck. How is the fats table layed out, I.e how many bytes for clusters and stuff. Any ideas on how to read the fats table in GFA BASIC. Some simple routines would be a help.

Thanks again.
Scott.

Hello all,

You can find the number of bits in a FAT in the boot sector strcuture. All informations are here, number of bits, first sector of FAT, FAT length, curter lenght, ...

In GFA Basci , simply use the XBIOS or BIOS function to read the sector (boot sector and after FAT sector) and acces with WORD{} or like.

Bye.

What about testing for the existance of one ore more files in a directory ? I need

a function (ttp program to be called from batch files) that can accept a wildcard as an argument and test for files in the actual directory that match it and return the corrisponding value, maybe the number of files found. This should work with TOS, MagiC VFAT or not.

I need it because I found that Okami Shell (any update) I used for my batches is corrupting the MagiC system, and want to use only MCMD that seems to be the only working CLI. MCMD is simple but you can always call external TTPs like Mupfel Tools, but I did not find a "file EXIST" function. MCMD "IF EXIST" does not accept wildcards. Is there something working, what is your favourite CLI for batches ?

I think I can do it with Lattice C and findfirst/findnext functions, but I want to be sure about longnames.

In the end I just want to tell you that I need this to program NODELIST/NESTLIST compiling on my system, what I was doing with okami CLI before was:

```
IN=D:\INBOUNDP
movetog()
{
     FILE=$IN\$1
     if [ -f $FILE]
     then
          mv $FILE C:\FILES\TESTI\
     else
          echo $FILE not found
     fi
}
#movetog HUB.600
#movetog NET.333
cd D:\INBOUNDP
if [ -f REGION33.??? ]
then
     cd D:\nodelist\
     zip.ttp -xo D:\INBOUNDP\REGION33.z*
     cd D:\INBOUNDP
#    movetog REGION33.ZIP
else
     echo REGION33 not found
fi
cd D:\INBOUNDP
if [ -f NESTLIST.??? ]
then
     cd D:\nodelist\
     lharc.ttp x D:\INBOUNDP\NESTLIST.*
     cd D:\INBOUNDP
#    mv NESTLIST.* C:\FILES\TESTI\
else
     echo NESTLIST not found
fi
cd D:\INBOUNDP
if [ -f NODEDIFF.??? ]
then
```

```
     cd D:\nodelist\
     arc.ttp xo D:\INBOUNDP\NODEDIFF.a*
     zip.ttp -xo D:\INBOUNDP\NODEDIFF.z*
     cd D:\INBOUNDP
#    mv NODEDIFF.* C:\FILES\TESTI\
     cd D:\nodelist
     rm *.bnl
     exec applylst.ttp -clean
     exec btnc.tos
#    rm D:\FILES\TESTI\NODELIST.ZIP
#    zip.ttp -a D:\FILES\TESTI\NODELIST.ZIP D:\QBBS\NODELIST\NODELIST.*
else
     echo NODEDIFF not found
fi
```

This was run just before Jetmail import TIC files.

So, how does one call _appl_yield()? Is it just

```
_appl_yield:
     move.w   #$c9,d0
     trap #2
     rts
```

Are there any restrictions on calling it?

Is it OK from a TOS app?

Is it OK from User mode, or does it require Supervisor mode?

Assuming other tasks aren't resource hogs (CPU/disc etc), how quickly will
I get control again? If all other tasks are idle, I'd assume it'd be
pretty much immediately.

Given a loop of the form:

```
  for a = 1 to largenumber
    do some processing
    if (a mod 100) equals zero  ; remainder( a / 100 ) = 0
      _appl_yield()  ; yield to other processes every 100th iteration
    end if
  next a
```

will this be OK? (please forgive my pseudo-BASIC pseudocode)

Thanks to the poster who sent that. I thought I'd include it here to
save bandwidth <grins>

```
>

```

I am. Somewhere...

>You could also change the loop so that it ends in a particular area within
>the file. I.e, UNTIL y$="END" or you could use UNTIL x=0 AND y=0. This is
>sort of decission making but must be set to what ever tag the file uses
>to say "yes all coordinates are read".

Well, yes. I'm just reading 3 lines using LINE INPUT 3 times.

>
>Also if your file has many coordinates whay not put them in an array.
>Before the loop you could set the array by...
>
>DIM x.crd(number.of.x.coordinates)
>DIM y.crd(number.of.y.coordinates)
[snip]

I lost it there. Thanks anyway

>
>Well hope this helps and is not over explained...
>

It *does* help, you give me ideas. The array bit lost me. I just "pick
up" GFA and never really learnt it.

Thanks

Hi!

First, please check your newsreader's configuration, as it's posting
endless lines for each paragraph.

Mike De.Petris <mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it> wrote:

I recommend using Mupfel (http://www.muenster.de/~reschke/soft_e.html).
It's a Unix-style shell with an sh-compatible syntax.

For example, to test for a file's existance, you'd use:

```
if [ -f fileordir -o -d fileordir ]
then
     echo File/directory exists
else
     echo File/directory is missing
fi
```

Anyway, a CLI like MCMD, which isn't capable of expanding wildcards
itself, IMO isn't worth using. Also, it won't work with the Mupfel tools
if you use wildcards, as those expect the shell to expand them - which
is a good thing as it saves code, and prevents different behaviour of
programs due to errors/differences in the wildcard matching routines.

> I think I can do it with Lattice C and findfirst/findnext functions,
> but I want to be sure about longnames.

For that, get the MiNTlib (current is PL49, IIRC) and use it's
POSIX-compliant functions opendir(), readdir(), closedir(), and (to name
all) rewinddir(). Also, get Rich $salz's globbing routine for the
wildcard matching - but note that you'll need to adapt them a little as
at least the versions I found on the net sometimes scan over the end of
the pattern or the matched string, which might cause your program to
crash with memory protection enabled.

Ciao

Thomas

> What about testing for the existance of one ore more files in a directory ? I need a function (ttp program to be called from batch files) that can accept a wildcard as an argument and test for files in the actual directory that match it and return the corrisponding value, maybe the number of files found. This should work with TOS, MagiC VFAT or not.
>
> I need it because I found that Okami Shell (any update) I used for my batches is corrupting the MagiC system, and want to use only MCMD that seems to be the only working CLI. MCMD is simple but you can always call external TTPs like Mupfel Tools, but I did not find a "file EXIST" function. MCMD "IF EXIST" does not accept wildcards. Is there something working, what is your favourite CLI for batches ?

Why don't you use Mupfel? It certainly works under MiNT and MagiC...

How can you say GFA is crappy if you've never used it? I would choose GFA over STOS any day Mr. Greenwood :)

Anyhow I believe a varible can be read from a file by using the INP(#n) command. LINE INPUT cannot do so because it is only used for strings. The only fault with the INP command is it only reads one byte at a time which can take quite long for large files.

Here is an example...

```
OPEN "O",#1,file.name$   !Opens the file
ERASE temp()           !Make sure array is cleared
DIM temp(LOF(#1))   !dimension the array
For loop=1 to LOF(#1)    !Start loop to read entire file
 a=INP(#1)               !Get the byte
 temp(loop)=a            !put it the array
NEXT loop                !Loop for all bytes
```

I'm not sure if this will work correctly though. I'm not sure the INP command increases to the next byte of the file. It does'nt hurt to try though. I'm sure GFA has other ways of read varibles/integers from files but I cannot recall them as of now.

Oh and Tony LOOK NO LINE NUMBERS :)

Scott.

GFA _will_ input a number directly into a numeric variable, if you use the correct code for it. The problem is Clair is using LINE INPUT instead of INPUT. The former reads a line into a string, whereas the later will input data of the type required for the variable. ie. a string for i$ or a number for i&, i%, i# and i|. Of course if the data being read is a number, and the type is a string, it will be read (in)correctly, whereas the program will give an error if it tries to input a string into a numeric variable.

You can't use LINE INPUT #1 for numeric variables, although you can use:

INPUT #1,text

to get the values required.

>>
>>thus text holds the number,
>
>No, it doesn't work, I think because the line is text, and you can't
>convert a normal string to a number string!

No, it doesn't work because the LINE INPUT is for inputting a line of text.
The LINE is added so that any ','s are not used as seperators in the INPUT
line.

>
>>
>>You would probably use a different name.. but the concept is to input
>>as a variable, no need to do it as text and convert..
>>
>
>That can't be done.

If you drop the LINE from LINE INPUT it will/should work. Of course there's

also the format of the file you're reading from. If it's just a list of numbers, generated by using something like:

```
OPEN "O",#1,"FILENAME"
FOR i=0 to 319
  FOR j=0 to 199
    PRINT #1,j
  NEXT j
NEXT i
CLOSE #1
```

the file can be read using INPUT #file|,numeric.variable whereas if you used:

```
OPEN "O",#1,"FILENAME"
FOR i=0 to 319
  FOR j=0 to 199 STEP 2
    PRINT #1,j,j+1
  NEXT j
NEXT i
CLOSE #1
```

you can't.

>>I have never used GFA..But would be amazed if it couldnt input as data
>>rather than strin$:)

Hi again everyone.

I was reading some information on ST disk structures and found that the dirctory sector is what holds the information about files on the disk. On floppies it is on sectors 11 through 17 (7 sectors long), and on hard disks is 16 sectors long.

Does anyone know how to read these sectors into a buffer and then access the buffer in 32 byte segments. Each directory entry id 32 bytes long and there are 16 entries per sector. Therefore I need to read in all the directories into a buffer and access it in 32 byte segments. Within this 32 bytes I must then again access 0-7 bytes for the file name, bytes 8-10 for the extention name e.t.c.

any ideas or routines in GFA BASIC would be greatly appreciated..

Scott.

What do you wanna do there ? You're messing with stuff deep in the
operating system, which should definitely be avoided unless you write
some rare system tool. So what is it that you want, and for which it is
not enough to use GEMDOS functions ?

The root directory does *not* always start on sector 11 (virtually never
on my disks), especially not on hard disks. And it's neither always 7
sectors long on disks, or 16 on hard disks.

Cheers Peter

I'm wrinting a disk utility/tool and want to find out how many hidden, system, read only, files are on the disk without having to use FSNEXT.

Also I want to be able to read in the fats table to trace file contents, i.e file data is stored in sector 1,4,8,9. I'm trying to write a utility to undelete files, defragment disks, e.t.c.

> The root directory does *not* always start on sector 11 (virtually never
> on my disks), especially not on hard disks. And it's neither always 7
> sectors long on disks, or 16 on hard disks.

So how would I be able to determine on where this starts then? All docmentation I have states the disk layouts are....

Sector		Length in sectors
0	Boot Track	1
1 - 5	First FAT	5 (41 on hard disk)
6 - 10	2nd FAT	5 (41 on hard disk)
11 - 17	Directory	7 (16 on hard disk - may vary)

With the extended FATS length on hard disks, the directory sectors mus also move ahead.

I need to read in the directory sectors, break it down into 32 bytes of 16 entries (512 bytes/sector) then from those 32 bytes retrieve this...

What It is	Bytes
File name	0 - 7
Extention	8 - 10
Attributes	11
Reserved space	12 - 21
Time stamp	22 - 23
Date stamp	24 - 25
Staring Cluster	26 - 27 (an integer)
Length (bytes)	28 - 31 (a 4 byte integer)

All this totals 32 bytes. I need to do this 16 times for each sector in the directory. The attributes hold...

Bit 0 read only
bit 1 hidden
bit 2 system
bit 3 volumn lable

bit sub directory
bit archive bit
bits 6/7 not used

These are what I need to retrieve.

Scott.

The Radio Play takes a completely different direction to the books,
basically after the prehistoric Earth bit.

The books were based on the BBC Radio Play y'know. The Radio Play is the
original. Also very funny :->

 g> at least the versions I found on the net sometimes scan over the end of
 g> the pattern or the matched string, which might cause your program to
 g> crash with memory protection enabled.

I hope this works with Lattice.
I am now using this small program I did yesterday:

```
#include <stdio.h>
#include <tos.h>

int main(argc, argv)
int argc;
char **argv;
{
     DTA d;
     int r=0;
```

```
     Fsetdta(&d);
     if (!Fsfirst(argv[1], FA_SUBDIR))
     do{
          if (d.d_attrib!=FA_SUBDIR)
          {
               r++;
          }
     }while(!Fsnext());

     return r;
}
```

This simple program returns the number of files matching the wildcard passed
as argument (parameter) in the current directory, I just need to adapt it
for the VFAT environment.

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

Hi !
I need, in my rsc editor, to select a font style for objects.
I know that there are severals of font selector and I want to
try to call them (i.e : XUFS, or the thing's font selector).

The only documentations I manage to find were in german,
so I ccnt understand anything.

Could one of you help me either finding english documentation
or explaning me how to call the fontselector.

Note that I use assembly language but I understant C.

Thanks.

Well. Read the AHDI release notes. They should tell you how to read the
BPB (and what's in there). They will also make you aware that the
logical
sector size is not necessarily 512.

```

Hmm, looks like the docs are quite old then. Here's how to work out how many sectors are used by what in GFA basic, since that's what you're using.

*****

```
DIM b|(16384)                                          ! buffer to hold a sector
' has to be this big to handle very big hard drives. See below for more info
'
b%=V:b|(0)
~BIOS(4,2,L:b%,1,0,device&)                            ! read boot sector into RAM
' use the BIOS to read boot sector
'
sectors&=256*b|(&H14)+b|(&H13)                         ! number of sectors on the
disc
numsec&=b|(24)                                         ! number of sectors per
track
sides&=b|(26)                                          ! number of sides of the
disc
numfat&=b|(16)                                         ! number of FAT tables
tracks&=DIV(sectors&,MUL(numsec&,side&))
'
space%=sectors&*256*b|(&H0C)+b|(&H0B)                  ! Total formatted disc
capacity
```

*****

Even with the above to get you're still going to need to know whether to use 12 or 16 bit FAT decoding. For this you would need something like:

*****

```
bpb%=BIOS(7,device&)            ! get the BIOS parameter block
secsize%=INT{bpb%}              ! sector size in bytes
clsiz&=INT{bpb%+2}              ! cluster size in sectors
clsizb%=INT{bpb%+4}             ! cluster size in bytes
rdlen&=INT{bpb%+6}              ! directory length in sectors
fsiz&=INT{bpb%+8}               ! FAT size in sectors
fatrec&=INT{bpb%+10}            ! start sector of second FAT table
datrec&=INT{bpb%+12}            ! start sector of first data cluster
numcl%=INT{bpb%+14}             ! number of clusters
fat16!=BTST(INT{bpb%+16},0)     ! TRUE if 16 bit FAT, else FALSE
```

*****

>With the extended FATS length on hard disks, the directory sectors mus
>also move ahead.
>
>I need to read in the directory sectors, break it down into 32 bytes of 16
>entries (512 bytes/sector) then from those 32 bytes retrieve this...

That will work for floppies, and partitions below 16Mb. It won't work for larger hard drives. With a hard drive the logical sector size, which is what you'd be accessing, varies according to the size of the partition. What you end up with is something like this:

Sector size (bytes)	Maximum Partition size (Mbytes)
512	16
1024	32
2048	64
4096	128
8192	256
16384	512

The above depends on the partitioning utility. I don't know about the ICD software, but HD Driver is cabable of doubling the maximum size of the partitions with TOS 1.(0)4 and later.

Anyway before I start rambling on, the above should give you some help.

Regards,
David. Email: dbolt@my-ste.demon.co.uk

> to undelete files, defragment disks, e.t.c.

No offense, but do you really think it's a good idea to write such stuff
if you even don't know how to determine vital data of a disk/harddisk?

Also, there are already a lot of programs which allow undelete and/or
defragmentation (Chkdisk3, Diamond Edge, Diskus, to name just a feq), so
why do you need that?

> So how would I be able to determine on where this starts then? All
> docmentation I have states the disk layouts are.... [...]

Use Getbpb() for that. It tells you everything you need to know. If
you're able to read German, you might take a look at the sourcecode of
CheckFat (it's included in the distribution, look for cfat_r4.lzh).

> Bit 0 read only
> bit 1 hidden
> bit 2 system
> bit 3 volumn lable
> bit sub directory
> bit archive bit
> bits 6/7 not used

Bit 6 is used by MagiC and MiNT's new FATFS for symbolic links. VFAT
additional entries for the long filenames have all 8 bits set, i.e. the
attribute is 15.

> These are what I need to retrieve.

You also have to remember that all information that require more than
one byte are stored in Intel-order, i.e. least significant byte first.
That applies to directory entries as well as to FAT entries.

Ciao

Thomas

For English documentation on how to use the font protocol (which is used
by Thing), get the English version 1.09 of Thing from InterActive's
homepage (http://www.cix.cok.uk/~inactive/), the hypertext documentation
contains what you need.

Ciao

Well the game is going to be a city wide chase type. No screen shots or anything yet because I'm still working on graphics problems which I cannot figure out :)

This disk utility is going to be able to (hopefully), defrag disks, format disks, copy disks, and undelete files. Also If your IBM has problems reading A ST formated disk, I'm trying to write a routine to change specific bytes on the ST disk to allow the IBM to read it.

Yes I know there are tons of these around but I'm doing for my own experience. What better way to fully understand how the disk BIOS/XBIOS work other than experimenting with them.

I also wrote a DATA BASE program with catagory references and the such. The program is a point and click interface with ZEST buttons. It is a type of freeware program. The program does have to be registered but its registration is FREE. All the user has to do is send me E-Mail and I'll send them back their own personal code to unlock all the program features. They will also recieve the code. I done it this way so I can keep track of ho many people are using it. This will help me to determine if the program is worth putting the time and effort into updateing it. Anyhow, this program is not in any ftp sites that I know of. I did file tag it

here one time but only had one responce. If anyone else wants to give it a try Just E-Mail me and I'll send you copy. Then again Tony if you want a copy for the magazine I could send you a copy as well.

Scott.

You shouldn't base your opinions on others opinions without first experiencing the language for yourself. If someone said million dollars was a crappy thing to have and you had been offered a million dollars,

Would you turn it down :)

```
> >OPEN "O",#1,file.name$   !Opens the file
> >ERASE temp()             !Make sure array is cleared
> >DIM temp(LOF(#1))     !dimension the array
> >For loop=1 to LOF(#1)    !Start loop to read entire file
>
> tut tut...should start at 0, especialy when using an array...
```

Hey the person is only new to GFA so I did'nt want to confuse them right off the start. Also real programmers usually leave in 0 index free in case they want to use a checking string/varible in there to test if it is really their file type :)

```
> > > a=INP(#1)                !Get the byte
> > temp(loop)=a            !put it the array
> >NEXT loop                !Loop for all bytes
>
> f$="filename"+chr$(0)
> if exist$(f$) then open in #1,"filename" else error sub
> dim temp(lof(#1))
> For loop=0 to LOF(#1) :input #1,temp(loop):next
>
> LOOK..Less code AND file exist error checking :.. hahaha
```

```
@test.file(file$)
If test!
 @read.file(file$)
endif
END

PROCEDURE(filename$)
 test!=exist(filename$)
RETURN

PROCEDURE read.file(file.name$)
 erase temp()
 Open "I",#1,filename$
 dim temp(lof(#)1)
 For loop=0 to lof(#1)
  Input #1,temp(loop)
 Next loop
 CLOSE #1
RETURN
```

Now mine will read all files as long as i send the file name to read file() procedure. Being able break a program down into procedure and using lable names for the procedures makes it easier to bug test and call :) There is nothing worse than always haveing to remember what line number you started a procedure in and then calling it by GOSUB 1540 :) what happens if you accendently go 1540 in STOS. There goes the line and you have to re-write it after you remember what it was. It is very hard to

delete lines in GFA by human error :) And yes Tony I know you can set uf procedure lables in STOS but the must be like read.file=1000 and called like GOSUB read.file. This still don't eliminate the cahnces of deleteing or overwritting a line, nor does help debugging processes. You still have to remeber waht line read.file is on :)

> the above shorter routine will work

Mine should work too.

> the problem was that someone told me you cant , hence my comments:)

Like I said before base your opinion on experience not assumption :)

> >Oh and Tony LOOK NO LINE NUMBERS :)
>
> and your point is ?..... ho are you suggesting you can't load a file
> if you use line numbers?...or perhaps you are suggesting it .... well
> what ?... what is the significance of having no line numbers?..

I guess you must have read my big spull on this from above, If you want a copy of my book its $29.95 and there's no table of contents because I don't believe in page numbers either :)

Anyhow believe it or not I do like STOS, I think it is a great simple to learn programming language. Alot of the command names actually refer to what they do such as ZOOM. I'm just having a hard time sticking with it.

> Anyway Scott we better make a run for it before the knitting class get

I've already got a routine to read the boot sector. This gives me
information about the disk format. I need to find information about files
on the disk. This is in the directory sectors.

Thanks for the responce though.

Scott.

Ok I got the BPB part because I've already got a routine for that. It
tells you where the FATS and stuff starts and you can determine where it
end by add the number of sectors it uses. The routine I use also states
how large the sector size is. Is this waht you mean. It returns the number
of bytes per sector the disk contains.

Yes, that's it.

> Are there any restrictions on calling it?
>
> Is it OK from a TOS app?

From a TOS program, you must be aware that people might want to start the

program without having any AES installed (for instance, having MiNT started a CLI from MINT.CFG). I do not know what is done by TRAP #2 before AES is installed, so this is a potentially dangerous situation.

However, if you can be sure that AES is there, you can call it from a TOS program too.

> Is it OK from User mode, or does it require Supervisor mode?

From my experience, it works in both cases.

Vincent,

This is a real nice accounting program that was special made for the
recording studio. I have run the demo, sometime back and it looked super!

I didn't get it because my business didn't warrant it. The demo was on
Genie which is now becoming part of the www. FWIW

Charlie

Studio Manager - Invoice/Accounting v 1.xx

PRESS RELEASE

We are pleased to announce the commercial-release debut of

STUDIO MANAGER - INVOICE/ACCOUNTING

With the availablity of an inexpensive yet powerful computer platform like the Atari ST, the concept of a computer-based studio management 'system' seemed the obvious way to handle the various 'chores' that exist in the operations of a recording studio.

Armed with a handful of commercial and public domain programs we went 'computerized'. With a stack of manuals to learn and assortment of floppy disks we shuffled through the patchwork. After two years of trying this and that, it was concluded that we have actually create MORE work for ourselves.

We are music people trying to compete in the business world. We were busy studying our craft, be it music theory, arranging, MIDI sequencing or acoustics and recording techniques.

We also wanted everything that left the studio to be of the best quality we could provide; from real-time cassette dubs to our client's invoice statement.

With a 'vision' greater than our budget, the decision was made to barter long days and nites at the computer in designing software to address the unique needs of the recording studio business and, thereby, help us in our overall pursuit. We were surely no stranger to this type of schedule, and the parallels between music production and software development provided pleasant revelations.

From a humble beginning, the 'INVOICE' program developed into a essential tool that was used daily in studio operations.

When other studio people who, looking over our shoulder or just 'checking out the computer scene', showed positive interest in using the 'INVOICE' program for their business, the decision was made to redesign the program architecture to work for any studio. We also gave it a name at that point.

In what was to be a complete source code re-write for the next generation of 'STUDIO MANAGER', with all new logic, features and a new graphic user interface, the motto 'UP ALL NITE' became our theme song.

For some, the closest experience with a keyboard was either a synthesizer or a typewriter, so the program had to be intuitive, easy to learn, and quick.

Documentation notes:

If I told you about one of the more difficult parts of writing this software package, it could easily be the documentation.

When I called on some of the various users of the program to assist in the doc writing process, they laughed saying who needs docs for the program ... it's self-explanatory. Of course, that was one of the fundamental concept that went into the design, so that may help explain some of the difficulties. The 'other' reason was the amount of features within the program that everyone had just grown accustomed to. Fair enough, but while the time drag on during

the doc writing sessions, I began adding requested features that were scheduled for the next version upgrade.

We decided that the outline approach to describe the operation of the program would serve the best beginning.

Other decisions had to do with the final 'form' of the docs. The spectrum of choices boiled down to either pre-printed booklets or the standard ASCII text file on disk.

So, the decision: we go the text file route and offer a special introductory price for a limited time. The user base can help us in making these, and other decision. As for the 'docs' issue, if it is concluded that pre-printed is the way to go, then every registered user will receive them. The expanded user base, along with the on-line support, should provide us insight as to how both the documentation (and software!) should mature.

At the very least, we hope that you find Studio Manager v 1.xx has the basic foundation you've sought in a working solution for your business of music.

I hope that you will join us!

Sincerely,

Ron

Future program development:

This being the debut commercial release of STUDIO MANAGER v 1.xx we have tried to provide a foundation base program to handle the immediate needs of the recording studio business.

The design for future versions will be based upon request from the users as to new features and functions to be implemented.

Aside from the Invoice/Accounting system, other studio related support programs in development include:

A client Fone Book database, Scheduling Calendar, Track Sheets, Tape Labeling and Pre-Production modules.

Be sure to stop in at the GEnie support message base in the MIDI RT (Cat 3 Topic # 2), or Email the author at RHFactor

Hello,

Does anybody know a place on the web where I can find some useful
C-libraries for my Atari ST?

Especially some menu, and other user-interface libs will probably help
me.

Hello,

Thanks for the reply

The software look (looked ?) Great ! I 'll like to find it... but where ???

Does anyone know if there is a web site or an email where I'll find some
more informations (price, ordering...)

Thanks again.

Hello everyone,

I'm writing a disk utility program in GFA BASIC 3.5E. I was wondering if anyone knows or could show me some sample code on how to do any of the following...

(1) Read the disk FATS table and decifer it.
(2) Read how many directories and files are on the disk
(3) Read/Change the disk lable
(4) Probably some formating routines

I really need to find a rountine for the FATS table. I want to be able to find system and hidden files. I also need to find clusters,sectors e.t.c. Also files which have been deleted but their data is still on the disk.

Thank's

Scott.

Use sector read routines to read the FAT.

> (2) Read how many directories and files are on the disk

Use Fsfirst-Fsnext.

> (3) Read/Change the disk lable

Read the directory sector change name write the sector.

> (4) Probably some formating routines

Use the OS format routines.

System and hidden files are found using Fsfirst Fsnext. No need
for FAT's overhere. Maybe you should first read some documentation
about the file system before even thinking about tinkering with
the filesystem. A good place to start is
http://www.komkon.org/fms/MSX/Docs/Disk.txt
which looks like a part of the ST discdoc program.

Maybe you should also browse the disk with a sector editor
so you can learn how things fit together. One of the best
dikeditors ever is (IMHO) norton diskedit. Don't worry
about it being a DOS program because the filesystem
structures are exactly the same. Try to learn about
the diskstructures with that program.

Succes, Hans Wessels

Scott Harris (harris@cs.mun.ca) wrote:

: (1) Read the disk FATS table and decifer it.

That should probably just be FAT (FAT = "File Allocation Table").

: (2) Read how many directories and files are on the disk

Easy. Just step through all the dirs recursively...

: (3) Read/Change the disk lable

Shouldn't be too hard, there's even a GFA-call that can do that IIRC.

: (4) Probably some formating routines

Check out some docs on XBIOS calls if you can find them...

You'll want to get at least the Atari GEMDOS manual, which has an appendix dedicated to FAT-fs structure. It should be on most of the good Atari FTP sites (I think Umich as wel...) or else try my page (see below, and hope the link is still valid...)

Good Luck,

This upsets me. The Amiga kernel is central to its efficiency and
general behaviour. Using another kernel will make it somwething else
than an AmigaOS.

I'd say it's neither or a little of both.

>I can't see a PC being 5-10X faster then the current PII by end 1999.

If the Amiga can, why not the PC? And how do you know this isn't
vapourware?

>Besides, what the hell is the problem with having another alternative to
>Intel ?.

I welcome all alternatives, but I want to keep the Amiga alive, and
I'm not sure that Gateway are planning to produce an Amiga.

Hi!

Jos den Bekker <josdb@xs4all.nl> wrote:
: Beware! We have vfat systems nowadays, and with those Fsfirst-Fsnext
: don't work. I've just tinkered with this.

If available, one should always use Dopendir(), Dreaddir() and
Dclosedir() to scan a directory. I posted an example here some time ago.

Also note that Fsfirst()/Fsnext() on VFAT partitions with SingleTOS
(i.e. without VFAT enabled) sometimes find the VFAT entries, which is a

bad thing. There are two ways to avoid that: Put HideVFAT into your
Auto-folder (I'll make that available tomorrow), or put a workaround
into your programs, like this:

```
fret = Fsfirst("C:\*.*", 0x17);
while (fret ==0)
{
    if (dta.d_attrib == 0xf) /* Is it a VFAT entry? */
        continue; /* Yes, so skip it */
    /* Do something with the file */
    fret = Fsnext();
}
```

Ciao

Thomas

What do you mean by the sector read routines? Are you talking about

BIOS/XBIOS parameter blocks?

> > (2) Read how many directories and files are on the disk
>
> Use Fsfirst-Fsnext.

Ok I was thinking about that, but what about the directories and files within directories. FSFIRST-NEXT only reads from the current directory, so this means whenever the loop incounters a folder, it would have to change to that directory and check its contents and so forth. Is there another way? Could I use the FATS table for this purpose. Just read it and count the file ends.

> > > (3) Read/Change the disk lable

So the disk lable is stored on a sector on the disk. So its just a read and write routine to that sector.

> > (4) Probably some formating routines

: the file ends.

You could do so, but of course it's nothing to use in an application,
but only in a special disk utility which checks whether the partition
it's reading from is really a FAT one.

: So the disk lable is stored on a sector on the disk. So its just a read
: and write routine to that sector.

To be precise, the disk label for a FAT filesystem is stored in the root
directory as a filename with attribute 0x8 (so, if one is set, it may be
located in any of the root directory's sectors). Simply use
Fsfirst("*.*", 0x8) (or Dreadlabel(), if available) to read it, and
Fcreate(labelname, 0x8) (or Dwritelabel(), if available) to set/change
it. No need to use low-level-stuff for that.

Ciao

Thomas

Greetings Atarians!

How do you (In GFA code) read incoming mididata?

Is there a way to check that the Midi-port really is present, without
making the
system hang, if so isn⍰t the case?

Regards,

/Joakim

One of the first big MiNT distributions, the TAF-kit, came with X11 as default GUI. It works nicely on a 4meg ST. But lemme get this discussion straight, so far the line was that an Amiga can do anything an Alpha can do in Linux because an Amiga will run Linux as well, but that this doesn't go for Ataris because MiNT isn't fully Linux compatible? Are we forgetting that Linux will run on an Atari as well? (And, again, that X will also work under MiNT).

Maurits.

    It may not necessarily go for MiNT.

    That does not address Atari in general.

    A Falcon will quite happily run Linux and could
    quite happily contribute to a D2 render farm
    right beside an Ameboa, an Alpha, a Sidewinder
    or any other supported platform...

Hi Gaven, below is some code I slapped together to solve this problem. It's
written in HiSoft Basic; if you don't have the compiler let me know and
I'll email you the uuencoded .PRG file.

```
' 80-CHARS.BAS
' Format text to 80 columns

DEFINT a-z

REM $include gemaes.bh

LIBRARY "gemaes","gemvdi","gemdos","xbios"

DIM s(50)
s(0) = 1

fsmessage$ = "Enter filename"
```

```
fspath$=CURDIR$+"\*.*"
fsname$=""

fin$ = Fileselect$
PRINT fin$

i=LEN(fin$)
IF i=0 THEN STOP

DO
   ch = ASC(MID$(fin$,i,1))
   IF ch="."% THEN EXIT LOOP
   IF i=1 THEN EXIT LOOP
   DECR i
LOOP
fo$ = LEFT$(fin$,i) + "FMT"

CLS
PRINT fin$;" -----> ";fo$

OPEN "I",#1,fin$
OPEN "O",#2,fo$
pp=0
DO UNTIL EOF(1)
   LINE INPUT #1,a$
   i = LEN(a$)
   IF i>79 THEN
      old_x = 0
      new_line = 0
      x=1
      s=1
      DO
         IF MID$(a$,x,1) = " " THEN
            IF (x - new_line)\76 = 1 THEN
               s(s) = old_x + 1
               INCR s
               new_line = old_x
               old_x = 0
            ELSE

Every so often, whilst debugging some code I've written, I see the 68k instruction "cmp.w #$c9,d0" in the start of the code that handles the GEM trap.

I know that $73 signals that it is a VDI call, and $C8 is for AES calls, so what does $c9 signify?

Use INP?(3) to check if there's data available at the MIDI port and
read the data with INP(3).

Hi All,

I was wondering if anybody out there knows if there is a C++ compiler
for the Atari platform? I can't think of any GEM C++ compilers, but
perhaps there is a MiNT version of the GNU C++ compiler?

Thanks.

Regards,

Ben Hills.

Correct, gcc is ported to MiNT/TOS/MagiC. It's available (with libs)
from all good ftp-sites. Try 'ftp.funet.fi/pub/atari/piwo-mint/Gcc'

Hi I am having a prob (as usual) with my evnt_multi() with the
avserver message it could send me.

ok: it says here on my manual that if I put addr_buffer (in the
evnt_multi()) = 0 it will check for menu(1) to menu(8) mu_mesag.

The thing is< how do I check if I get a message from the avserver?
the ideal would be to put addr_buffer in the evnt_multi and then i
woul dbe able to check that. But then all the regular aes messages
won't be seen at all.

Clear enough?
thanks :)

Hi all,
I am thinking of adapting some existing tools (the c68/jas compiler and assembler) for a personal project, and I might also need to create a simple custom linker.
I've looked around a bit and I haven't been able to find the definition for DRI object files. Is this documented anywhere? (For Motorola 68k object code)

Thanks in advance,
-Russ Magee

This will read a single byte from the midi port, only if theres something
to read:

```
IF INP?(3)
  value&=INP(3)
ELSE
  value&=-1
ENDIF
```

The reason for using value& (word) instead of value| (byte) is, if there's
nothing returned, then value& will be -1, whereas if something is available
it will be in the range 0 to 255.

There are any number of programs that would break down the long ascii
lines for you. QED is freeware and can be set to auto wrap long
lines. Many of the standard word processors will also do it.

If I understand you correctly...
The gfa MENU(x) values are not advised when the true EVNT_MULTI is
used. The solution is to link addr_buffer% to the MENU(x) table, so
don't use MENU(x) but your own table such as :

```
FUNCTION ev_multi(em_flags&,em_cl&,em_ma&,em_st&,em_ct%,VAR
em_mx&,em_my&,em_mk&,em_kbd%,em_key%,em_click&)
  '
  INT{ADD(GCONTRL,2)}=16
  INT{ADD(GCONTRL,4)}=7
  INT{ADD(GCONTRL,6)}=1
  INT{ADD(GCONTRL,8)}=0
  '
  INT{GINTIN}=em_flags&
  INT{ADD(GINTIN,2)}=em_cl&
  INT{ADD(GINTIN,4)}=em_ma&
  INT{ADD(GINTIN,6)}=em_st&
  FOR i&=8 TO 24 STEP 4
    LONG{ADD(GINTIN,i&)}=0
  NEXT i&
  INT{ADD(GINTIN,28)}=WORD(em_ct%)
  INT{ADD(GINTIN,30)}=WORD(SWAP(em_ct%))
  '
  LONG{ADDRIN}=addr_table%
  '
  GEMSYS 25
  '
  em_mx&=INT{ADD(GINTOUT,2)}
  em_my&=INT{ADD(GINTOUT,4)}
  em_mk&=INT{ADD(GINTOUT,6)}
  em_kbd%=INT{ADD(GINTOUT,8)}
  em_key%=INT{ADD(GINTOUT,10)}
  em_click&=INT{ADD(GINTOUT,12)}
  '
  FOR i&=0 TO 7
    menu&(SUCC(i&))=INT{ADD(addr_buffer%,SHL&(i&,1))}  ! solution
  NEXT i&
  '
  RETURN GINTOUT(0)
ENDFUNC
```

The simpliest way is to look in INT{attr_buffer%+x*2}

>The thing is< how do I check if I get a message from the avserver?
>the ideal would be to put addr_buffer in the evnt_multi and then i

>woul dbe able to check that. But then all the regular aes messages
>won't be seen at all.

AV_SERVER messages are like AES messages coz they use the same GEM pipe.
                                                            ^^^^

The difference is that AV_SERVER message codes which are higher
(MENU(1) is over 100). See german TOS.HYP (cool developper
documentation for the codes).

Did I answer your question ?

Cheers

Pierre (Rajah Lone)

Hi Katherine,

i'm not sure to understand very well your problem, But it seems that you want to use
evnt_multi()
to get a specific messages from "avserver" and the standards system messages ???

In this case, there are no problems. You do a standard evnt_multi() call like follow:

```
Message    =    evnt_multi(...)
```

and when a message OR any other event will occur, evnt_multi will return these informations into Message.

to know if it is a message AND what is it you need to do:

```
if( Message & MU_MESAG)
    /*    This a message, standard or from another application. So you need to check
what there are
    into the Array message[1..8] , passed in parameters of evnt_multi   */

    if( message[0] = <a message code>)
        /* to what it must do ! */

else if( Message & MU_TIMER)
    /*    For example the GEM timer,  (time elapsed) */
```

check your mail, i will send to you a source example i written... ;-))

Thanks to all of you :)
I finally managed to get it to work.
The prob was:
That if I put the addr buffer as argument in my evnt_multi() I
couldn't see the regular aes messages (redraw etc), Because I was
still using MENU() >>> not good ;)

So now it is fine:
evnt_multi(,,,,,varptr(msg&(0)),,,,,)

If event& and mu_mesag
select msg&(0)
case wm_topped
etc
This sheme works :)
Thanks!

```

I suppose, if I use Fxattr(0,filename,&xattr) instead, I get this value in xattr.attr as well?

The reason I ask this is, that under MiNT and MagiC, when Pdomain() will be naturally set to 1, you might have a non-vfat partition, and then Dcreate() and Dopen() don't work. I suppose this isn't hard to remedy, since I can test for vfat before these calls, set Pdomain(0), and again Pdomain(1) when I'm finished. Is that correct?

I suppose the same goes for Fcreate() and Fopen(). But now another problem occurs with existing compilers and their standard libs. I have PureC and use only fopen(). If, under single TOS, I try to open a file with long name, e.g. X:\longnames\dontknowif\ilikethem.period, then fopen() will find and/or open a file X:\longname\dontknow\ilikethe.per Under MagiC or MiNT, however, fopen() will fail on a non-vfat partition and errno says "Path not found" (this is PureC's fopen()). Do I have to write my own fopen() now, or is there another way around this problem?

Whoops. I guess I wasn't thinking things through - I could manipulate the ASCII file into the correct format (instead of decoding the STW format into the required type)

Fxattr() yields non-0 if it can't access the file or directory, so on
second thought it's not a good idea to use that as a test of the
drive/partition.

Is there a good and secure way to test if a drive/partition is vfat or
not?

You doesn't need this information. Also, there are other filesystem
available (MinixFS, RAM-FS).

I doesn't see any problem if you use Dopendir/Dreaddir/Dclosedir and the

new calls that support long and casesensitive/casepreserving filenames.

No. The VFAT entries are not visible for you. Only if you access the
device direct.
Also, the FAT entries are also not visible.
And, there are other filesystems available with a completly different
structure.
Your program doesn't need any information about the phyisical structure
of the filesystem.

Hi,

I'm looking for the Atari version of GNU C++ v2.8.1, which I have been
(reliably) informed is now available. Does anyone know where I can find it?
I am currently using v2.7.3 which works very well - but it would be nice to
have the latest one.

I remember going through this nightmare about a year ago, when I
was trying to link GENST generated assembler with GCC object
files.

The closest I got was finding sourcecode for a freeware linker, but
I can't remember the name. The source for the GCC linker is also
easily available, but it doesn't support DRI or GST formats. You must
convert these to the GCC linkable format using another tool. :/

Sorry I can't help more than this. But the linkable file formats have
always been a bit of a problem on Atari - documenation wise and
availability wise.

Hi!

Frank Naumann <fnaumann@hppool.cs.uni-magdeburg.de> wrote:
: No. The VFAT entries are not visible for you. Only if you access the
: device direct.

Or - as already mentioned - if you use Fsfirst()/next() with certain
versions of SingleTOS and certain search attributes. That's why there's
HideVFAT for SingleTOS, which I'll upload in a few minutes to
ftp.cs.tu-berlin.de

Oh, I forgot: You'll also need HideVFAT with MiNT prior to 1.15 (which
is still in alpha state), because Dopendir() & Co. internally also use
the Fsfirst()/next() of the underlying TOS on FAT partitions, and
therefore 'find' the additional VFAT entries. This may be dependent on
the TOS you're using, but it is true for TOS 4.04 at least.

Ciao

Thomas

Maybe Andreas could patch Magic for it to act as single Tos does ?

I've been tracing a bit in the AES lately (working on XaAES (yes, a new
(much more stable and better working) version has been released (source
only for the actual beta7+ so far) and can be found on my ftp site (join

the XaAES mailing list if you are interested in this)) and as far as I could see, the ĉC9 seems to be used as a kind of AES equivalent of Syield(). That is, it won't do any work but will cause a 'task' switch if possible.

This was never documented, AFAIK, but it has also been used to test for the presence of an AES, which is why you'll find it in for example the XaAES trap code.

256 colour rgb tables
Is there a fool proof way of getting these correct. I wrote a programette a while ago that converted Mac icons into Atari icons in a resource file? An American user has just mailed me

> I use MagiCMac and also have an Atari TT030. I use Icon-verter
> frequently to convert icons from mac os to GEM, but I have noticed
> the B&W and 16 color icons are always fine, but the 256 color

> pallette mapping from the mac os pallette to the standard GEM
> system pallette?

On my LC475 with MacMagic and Ease they look fine using the RGB table that Interface generates when it saves colour icons in RSH long format as the Atari RGB table.

If I try to build a table using vq_colour() values it is terrible.

At present I just use a secondary program to compare the Atari RGB table with the Mac 'clut' resource and generate a Mac resource source file that contains a table where the index is the Mac Colour and the data is the corresponding Atari colour. (Mac 'clut' RGB table is expressed in values of 0-65535 while the Atari is in 0-1000).

Any ideas.

Matthew

But there obviously are problems. Under MagiC and MiNT, Pdomain() is
set to 1. But in that case, Dcreate(path) will fail if `path' is, or
contains, a name > 8 chars. But I don't want it to fail. I want it to
work as under plain TOS, i.e. with names truncated to 8 chars. The
same goes for Dopendir(), etc. So if I know I have a vfat drive or
partition, I can bracket those calles with Pdomain(0) and Pdomain(1)
calls.

Hu? I was talking about a program with Pdomain() set to 1. Surely the
vfat entries are visible then, aren't they?

But as it happens, you can have a non-vfat partition under MagiC and
MiNT as well. How do I test that?

>And, there are other filesystems available with a completly different
>structure.

Well, I don't know about those other filesystems. What do you mean?
Can they be accessed and used under MagiC and/or MiNT?

>Your program doesn't need any information about the phyisical structure
>of the filesystem.

What I want to know is: Do I have a drive/partition that doesn't
support long, and/or case-sensitive, filenames? Because if I have it,
Dcreate(), etc. fail with Pdomain() set to 1.

FS: I am selling a bunch of my Atari stuff in order to raise some money toward the purchase of a TOS clone. I haven't decided which clone to buy yet, it'll be a toss up between the Milan and Wizztronics machine.
I have divided the stuff up into two groups. The Jaquar Group and the ST Group, and that's how I want to sell them. I live in Loudoun County, Virginia which is in the greater Washington, D.C. Metro area, so I'm looking for buyers primarily in that area , it'll cut down on the cost of shipping :).

JAGUAR GROUP
Complete Atari Jaguar
Complete Jag CD
11 Carts and 3 CD's

ST GROUP
Complete 520ST with 4megs of memory
19 Programs, 27 games, and 1 joystick

Interested persons may email me at: Seahawker@juno.com
Thanks,
Sam Ferrer

Anyone interested in writing TWAIN scanner support for TOS based systems (preferably through the use of Parx's M&E System Folder) can do so by downloading specification 1.7 from the TWAIN Working Group's webpage. This way, we can finally get to use those inexpensive Visioneer PaperPort scanners on our lowly Atari computers! I'd love to hook up the Mac version to my Falcon's LAN port.

> I'd love a DEC Alpha machine -- all I need is to see NT have better game support, along with hardware support for > Voodoo2. Maybe a Matrox MGA-G200? :>

They used Photorealistic RenderMan from Pixar. This is a quite expensive aplication, only used for rendering. The RIB data (RenderMan Interface Bytestream) was generated by an export function of 3D-Software Softimage.

A even better renderer is freely available for Linux, the Blue Moon Rendering Tools (BMRT) of Larry Gritz. This software is a combination of a raytracing and radiosity renderer.

As 3D modeling tools you can use Amapi 2.11, SCED, Leo3D or AC3D. For correctly moving physical bodies you could use Xaero.

And ofcourse you have good old POV ray, whici can be a very fast renderer when you are yousing a Beowulf configuration.

I am quite sure this list wasn't complete.
So there are some 3D tools available for Linux.

(No I am not a 3D software specialist. I am just a reader of the excelent German magazin C't (Computer Technik), they have a very good coverage of Linux items.)

Hans

Hello!

Has anyone here succesfully set up a plip connection between an atari/MiNT box and a Linux/PC?

Why
>buy something worst, heh? Obviously, they want to copy it.

AFAIK Alpha processors are manufactured by Digital which is now owned by
Compaq and they're the one who own the technology. Judging from your
conversation Intel have bought or licenced Alpha technology, is this true?
If that's the case, where can I find more information about this since I
have obviously missed something.

But this copy part is ridiculous, Intel needs the latest in technology just
because of their efforts to keep the old structure and concept they used in
the Intel x86 processors. A concept dating back more than Intel CPU's and
that was great ... back in the 80's in the first Z80 home computers. Today
Alpha and PowerPC processors are way ahead if you compare the ratio between
technology used and performance given. Intel has often used better
technology if you look at plain electronics involved. Still they get
outperformed by relatively simple and cheap RISC processors.

     Linux/68k ~ Linux/Alpha...

     It's the OS, not the hardware that's the central
     point. D2 is a unix shop so any other Unixen fit
     in rather easily there...

--
Hardly. Microsoft has brought the microcomputer OS to
the point where it is more bloated than even OSes from
what was previously larger classes of machines altogether.
This is perhaps Bill's single greatest accomplishment.

If that is the case you can still do it with most things with a CPU
and now Linux. You can run Linux and MiNT on a ST, so a ST can do it,
so what is the bid deal?

Hi!

In article <Pine.BSI.3.96.980704120947.25032A-100000@usr01.primenet.com>,
     Katherine L Ellis <kellis@primenet.com> writes:

```
> function exist(p$)
>  $F%
>  local r!,e&,sdta%
>  inline dta%,64
>  p$=p$+chr$(false)
>  sdta%=gemdos(47)    ! get old dta
>  ~gemdos(26,L:dta%)  ! set new dta
>  e&=gemdos(78,L:V:p$,W:false)
>  ~gemdos(26,L:sdta%) ! reset the old dta
> [...]
```

An even better method would be to try Fxattr() first, as Fsfirst() (which is used here) can't handle long and case sensitive filenames correctly.

As I'm not such a good Gfa-coder, so please don't bash on me if the following is not fully correct:

```
[beginning of function (up to and including the inline-statement) as above]
  local xattr&(22) ! 23 words (0-22) for the XATTR result (46 bytes)
  local xr% ! Fxattr() return value, must be a long to check for EINVFN
  '
  p$ = p$ + chr$(0)
  xr% = gemdos(&h12c, 0, l:varptr(p$), l:varptr(xattr&(0)))
  if xr% <> -32
    ' Fxattr() is supported by the OS, so check whether it succeeded
    if xr% = 0 then
      return true
```

```
    else
      return false
  else
    [insert code of original function from sdta%=... onwards]
endfunc
```

Note, though, that both the call to Fxattr() and the call to Fsfirst() do not check whether the found item is really a file or not. It may be anything, a file, a directory, and (for Fxattr()) a fifo, a device, a process file, etc.

Also note that my call to Fxattr() does dereference symbolic links, e.g. it checks for the existance of the file a symbolic link points to, if the given name refers to a symbolic link. If you don't want this, exchange the 0 in the gemdos(&h12c)-line into a 1.

As far as I know, Gfa does not allow structures (or records, if you want), so using the stuff Fxattr() put into the word array is a bit tricky, as you have to know the exact offsets and especially because some members are longs, not words. But you'd only need that to check whether the directory entry p$ really is a file, and nothing else.

Ciao

Thomas

     Download the source and re-compile it on your Falcon or
     Ameoba. This should work with Linux as the rest of the
     system is open source.

Hardly. Microsoft has brought the microcomputer OS to
the point where it is more bloated than even OSes from
what was previously larger classes of machines altogether.
This is perhaps Bill's single greatest accomplishment.

But how many Amigas do you want to use to do it? Rendering is strictly a number crunching affair. Rendering has nothing to do with the graphics hardware that makes the Amiga special. One Alpha machine running at 533 Mhz can probably do what 50 to 100 '040 Amigas could do. Just the savings on power consumption would justify the use and purchase of ONE Alpha as opposed to upty million Amigas. And the Titanic people were using a FARM of Alpha's to do the rendering. And yes, other tools were used to generate the scenes. If I remember correctly Mac, NT, and Unix boxes were used to generate the scenes.

    I doubt that a Unix shop like D2 would put up with Mac
    & they likey only put up with NT because of it's market
    inertia/vendor support.

    NT was the frontend, Linux was the backend. Although a
    port of Lightwave to yet another Unix shouldn't be too
    strenuous...

Judging from the replies, it looks like EXIST doesn't set a DTA
buffer, or sets it incorrectly.

Possibly.

>any suggestions?

You'd have to write some code to insert relevent data into one of the
buffers used by Kbdvbase() and have some scheme whereby you could tell
it was really midi data when the app received it.

An easier and (imo) better solution would be to send the midi data
straight to your application via appl_write().

Can you explain how this would be done?

How does appl_write() distinguish between different types of data?

Greetings, FPK-Pascal (FPC), can now correctly produce m68k code, i'd like
to know if someone would be interested in porting the run-time-library to the
Atari... In all cases, an Amiga binary version should be available within
weeks. Please contact me via e-mail if interested.

In 1988/89 I was running X11R3 on a 4MB Sun 3/50 (68020 based UNIX
workstation) and other Sun 3 machines. There is no problem running X
in 4MB. Of course I don't know how big a footprint MiNT has (my Mega
4ST has been in storage for a few years).

Does anyone know how to use WF_KIND() to add window elements to an
existing window?

I want to add a vertical slider and arrows to an existing (and open)
window. I'm using the GFA call

```
      ~WIND_SET(handle,1,&X111001011,0,0,0)
```

Theoretically this should do the trick, but nothing happens. I've
tried closing the window first then reopening it, doing a redraw...

I could delete the window and then create a new one, but I'd prefer to
just change the existing one.

Greetings Atarians!

I wonder if a GEM-window can have another borderwidth than 1 pixel?
If so,

* What AES is capable of handling this?
* How can I find out the current width?
* How do I set border width value?

Thanks in advance...

/Joakim

Subject: Scancodes for extra keys
Date: 1998/07/10
Message-ID: <GWKZCXG@tos.pl.net>#1/1

X-Deja-AN: 370063029
Organization: Tariland Computer Club
Newsgroups: comp.sys.atari.st.tech,comp.sys.atari.programmer

Are there any scancodes defined for the extra keys present on some keyboards (I am looking at a AT keyboard), for example the F11 and F12 keys, End, Page up, Page down, Scroll lock, Num lock, Print Screen and Pause. Also some newer keyboards have a few extra keys as well, such as the "Windows" key.

If there are not any scancodes assigned to these keys, how should they be handled on such a keyboard? What should keys like Scroll lock and Num lock do? What does Scroll lock do on a normal IBM compatible?

With Num lock I could make it simply return number keys when on or arrow/alternative keys when off on the number pad, is this the correct behaviour, or will this be handled by TOS if I make Num lock send the correct scancode? If the latter, how should I know when to turn the num lock light on the keyboard on and off?

As for caps lock, the computer can at any time change the state of the caps lock without telling the keyboard, I believe, so is there any way I can know what state the caps lock light should be in (on or off) at any time?

(I'm talking from the point of view of the keyboard.)

Thank you for any hints.

The border around the window can be any width. Your application software doesn't have to know how wide it is, but you can find out by using wind_get. The original Atari AES never used a border wider than 1 pixel, and there's no way to set that. If some other AES does allow that size to be configured, you would have to look at the documentation for the particular program, since there's no standard way of doing it. Application software doesn't need to worry about the border width anyhow.

AFAIK, this is not implemented, at least not in any builtin AES upto TOS 3.x.

Hi,
I'm trying to compile some code using SozobonX 2.05 (?I think). The code will compile with the default (-mshort) int size, but if I compile with -mlong, the code bus errors somewhere during C startup, before main is entered. (Looks like somewhere during or slightly after parsing the environment variables, in MonST). I'm running on an Atari TT/030, TOS 3.06.
Is the -mlong option just broken, or do I need to include special libs, or what?

Thanks,
-Russ

Geneva can give you complete access to the OBJECT tree which makes
up a particular window frame. I've used this feature to replace the
FULLER button. Needless to say, the code is not portable.

If anyone's interested in picking up the Abacus Software series of
books on the Atari ST, I've put a couple up on the ebay auction site.

If there's enough interest I'll post more of the series, as well as
some 68000 assembly language books.

It's in the GFA manual at least...

There are some programs around (like KIVI QWK) that allow you to
customize window elements on the fly. I would imagine that WF_KIND is
used for this purpose, unless there's another call that I haven't come
across.

In KIVI the change of window elements is very smooth and it sure
doesn't seem like the window is being deleted and then re-created with
new elements. How do I do this?

HI all,

I am after people to interview for MEGA issue 3, If you run a
softwhere house, PD libary or similer then I would like to do a quick
interview with you. makes good free addvertising as well.

If you know any good links to interviews such as the crew in Star
Trek then I would like to use them.

Anyone who helps I will of course add you to the credits in issue 3.
Thats if you give me your name that is ;-)

It's also in the Abacus GEM programmers reference and Compute!'s Technical

reference guide Atari ST: AES, so it has been documented. I wonder if it's
in the Compendium, anyone with a copy care to look and see?

It was several months ago. I read it in a mag, so I probably won't find the
mention of it.

I am trying to write some user manuals and readme files, using Atari Works.

If I select "Export file" from the menu, and then choose "plain ASCII", I
get a file containing a number of _very_ long lines (200-300 characters or
more) for each paragraph. (read: each paragraph becomes one long line of
ASCII)

Is there some source code somewhere I can use to read and translate the
STW file that Atari Works saves its text into, into 70-ish width lines?
Or is there a utility I can use?

Doing so by hand, using an ASCII editor (like the one included in Devpac,
Lattice etc) is tedious when the files get lengthy.

WF_KIND used to be listed as a parameter to wind_set() and wind_get()
earlier on (pre-1990).

```
     ie "wind_set( handle, WF_KIND, NAME|CLOSER|MOVER, ...)"
```

I can vaguely recall seeing it listed in the (circa 1986) Megamax C
manual.

And WF_KIND is still #defined in the Lattice C 5.60 aes.h file, but isn't
defined in either the v5.06 (ring-bound! one function to a page! hooray!)
or the 5.60 (perfect bound. many-funcs per page. boo!) manuals.

```
     #define WF_KIND         1
```

What does it say about it in these two books? I really would like to
use something that could change window elements on the fly. CAB does
it, KIVI does it...how do they do it?

:in 4MB. Of course I don't know how big a footprint MiNT has (my Mega
:4ST has been in storage for a few years).

According to reports (years ago) in this forum you can have X with an
xterm and a shell up and running without problems (in 4 meg), but thats
about it. MiNT itself is not the problem. The Xservers I have here are
sized in the range 2.5 - 3.5 megabyte. I'd guess that the one for ST is
about the same size.

I don't know about KIVI, but CAB uses "faked" window gadgets. It's not
real window gadgets, but self build which acts just like the real thing.

Hi there,
        along time ago there was this cool little hand held console
called the Lynx. Unfortunately it was too bulky and had too short a
battery life and was discontinued.

The Lynx Development kit was little box from a company called Epyx,
who originaly designed the "Handy" console (a.k.a. Lynx), and the
engineers also worked on the original Amiga!!!

This little box, called Howard I think, linked to the Amiga via the
parallel port.

I was wondering if anyone had one of these development kits and the

software, possibly in a dusty corner somewhere....

Perhaps your company did Lynx development and you have a couple of
devkits in the warehouse gathering dust??

I'd really like to get hold of one, so if you have one get in touch

Cheers
Alex Holland

P.s. I dont read Usenet too often so email me direct could you??

It isn't possible at this time. Not in TOS. Not in MagiC. Not in N.AES.

>CAB does
>it, KIVI does it...how do they do it?
CAB uses its own window elements (because of Frames).

Bye,
Mani

I believe there was once a commerical magazine called '"ST World"
which was the first of the ST Mags to die. Is there anyone who can
provide me with some info about it including a screenshot of the cover
in Gif format? I want to write an article on it and I need to know...

1. What year (and month if known) was the first issue released?
2. What year (and month if known) was the last issue released?
3. Why did it cease publication.
4. General info about the contents IE: tutorials ran, regular features
(news, PD Reviews, other reviews etc).

I would be grateful if anyone could give me as much info as possible
on this.

Note: I am talking about ST World and not Atari World, two different
magazines.

Most likely via manipulating a normal OBJECT tree.

It's not possible, Linux and MiNT use different protocols for IP on
the parallell-port. Unfortunelately the ST's (and all other models for
that matter) parallell-port doesn't support all signals used in
Linux-PLIP, so Linux will have to adapt to MiNT in this case...

According to both Compute!'s AES and GEM programmers, it's supposed to set
the window control flags, as you'd think it should do, although from the
returned value when trying it out, it doesn't exist.

The only thing I can think of, and it's a wild guess, is that these two,
and some other manuals and programming guides, took the info from the
PC-GEM docs rather from what had been implemented in ST-GEM.

Hello,

I'm a french owner of an atari mega Ste

1) ****** I'm looking for softwares for it *******

I'm looking for

TRAX Recording Studio Utilities
(Tracksheet plus)
by Quentin Rice
(c) Quinsoft 1990

I had a demo of this and I'll like to buy the full version.

(It allows you to print a cue list, a track sheet, a mix sheet and you can store the names and adress of the consummers and musicians in a database.)

I also looking for :
-'Studio module' for Cubase V3.0 Atari.
- Dr T's XOR (Universal Patch Librarian for Synth's sounds)
- other Editor/patch/Librarian witch is fully compatible with Notator/softlink and can manage sounds of Roland D70 and Yamaha SY99

2) ****** I'm looking for a programmer on Atari St********

2.1) If I can't find Trax (see above...)
I'll like to have a soft for manage a small recording studio

2.2) the 2nd software must be faster because :

It must be able to show 41 differents "midi control changes" on one screen like 41 bar graph.

The control changes are showing the moves of the faders of an automated mixing console Tascam M3700. For each fader (32+8+1=41) the console send 3 midi bytes like :

-in midi : Controlchange,fader n°,Value
-in hexa : Bn,yy,xx where 'n' is the midi channel (0h to Fh), 'yy' is the number of the fader (00h to 25h), 'xx' the level of the fader (00h to 7Fh)
-in deci : 176+(n),yy,xx where 'n' is the midi channel (0 to 16), 'yy' is the number of the fader (0 to 41), 'xx' the level of the fader (0 to 127)

I tried with the cubase midimixer but there is 3 problems :

-1) The fist fader send a CTRL CHGE n°0 and this is not reconize by Cubase
-2) Because of the size of the cubase's faders, you can't see 41 faders in the same time on the screen (you must scroll the bars)
-3) I already use midimixer's objects for FX programming and I can use only 127 object simultaneously

I don't know if some software for other mixing consoles can work (Allen & Heath,
Soundtracks, Soundcraft ??...) I'm specialy thinking about 'Spirit Auto' Software or 'big by langley'.

Thanks for answering to my email

Here you are: It is only a simple one, but it is goodenough for not very
large amounth of strings (up to 10000 I think)

```
long Hash(char* string) {
long res;
     for(int i=0;i<strlen(string);i++) res += res << 4 + string[i];
     return res;
}
```

stay tuned

Hi all, A Clauss, ASH, etc

Is there any chance that the new CAB version will evaluate and
use the iframe tag from IE4 and the frameborder="no" or 0 extension
as these tags are quite useful,

cheer/

Don't know, but I would hope CAB would stick to HTML 4.0. Is this an
IE4 specific tag?

This will make it *very* inefficient especially for large strings, and you
are discarding most of the info from string contents anyway.

Why don't you use the 'mother of hashkind' :

```
int HashCode(char *string)
{
 char ch;
 int code = 0;

 while((ch = string++)
 {
  code += ch;
 }

 return ch;
}
```

It's dirty code, I know, but the idea is to just add all ASCII values in
a integer ; it will wrap around to negative when the upper limit is exceeded.

Greetz,

rand() should return a fixed set of random numbers. That is, each
successive call returns the same random number as last time you ran
it. This may seem odd but the advantage is you can debug programs this
way. For true (pseudo) random number generation you have to 'seed' it
with srand(). The number you pass to srand() should be 'evenly
distributed' - that is, at the point you do srand(whatever) then
'whatever' should have as good a chance of being one value as any
another. Typically, using the system 200Hz timer does the job.

Additionally, if rand() relies on the system Random() call then note
that Random() has 50% distribution on the lower bit, according to
docs. This will make bit 0 useless so >>1 etc.

objc_draw() writes to the logical screen address but multitasking
systems prevent you from making effective use of it, as might a video
card.

>(If I sound like I⍰m confused.. ...that⍰s probably because I am.. 8)

If at all possible you're best off responding to the normal WM_REDRAW
message in the usual way. Faster machine's will be able to cope and
such operating systems as MagiC have their own redraw enhancements
where unecessary redraws are eliminated, in addition to such schemes
as NVDI's font cache and other optimizations.

They are IE4 introduced but as much as i dislike msoft they are useful and
are supported by netscape 4.

atleast the frame border tag for normal frames would be good.

have fun :)

But this will generate lots of identical hash codes, say for anagrams or post codes or telephone numbers making it useless for data lookup....

Take this into account by making the order of the characters part of the hash function.

Personally I use Lattice C's _hash() function which has never produced duplicate values so far.

 True, but then you assume you know what your strings look like. If your
 strings are random, then this one is good enough (I used it recently in
 a compiler to hash identifiers, and had no problems with too many
 collisions).

: Take this into account by making the order of the characters part of the
: hash function.

 Then I recommend the Fletcher Checksum : easy and takes care of position.

: Personally I use Lattice C's _hash() function which has never produced
: duplicate values so far.

 Well then, I suppose the writers of Lattice C have shattered all Computer

Science theory ;) Never, you say ? How do you know ? Have you checked
them all ? [Just kidding].

Bye,

```

You'll need strings of more than 256 characters for that wrap around to
happen...

>: But this will generate lots of identical hash codes, say for anagrams or
>: post codes or telephone numbers making it useless for data lookup....

If your strings are random you don't need a hash function!
Just take the first couple of bytes and use that... ;-)

> a compiler to hash identifiers, and had no problems with too many
> collisions).

In most programs there tend to be lots of variable names with one to four
characters and with your scheme they would all get a hash number less
than a couple of hundred. Actually, things are much worse than that since
characters only use a very narrow range of numbers.

Still, unless you have to worry about large programs with thousands of
identifiers, you can probably get away with it.

>: Take this into account by making the order of the characters part of the
>: hash function.
>
> Then I recommend the Fletcher Checksum : easy and takes care of position.

Haven't heard about that, but a simple shift of the 'sum' before adding
each new value is lots better than what you suggested. Even on an old
68000, the speed difference should be very small.

>: Personally I use Lattice C's _hash() function which has never produced
>: duplicate values so far.
>
> Well then, I suppose the writers of Lattice C have shattered all Computer
> Science theory ;) Never, you say ? How do you know ? Have you checked

He said he'd used it personally, so it would of course be for the data
he has thrown at it.

I guess we all agree: Atari could have been a contender, but it suffered through several managements that just didn't manage. It's no sadder today than when you and I first discussed it; in fact, I think the situation is even brighter today than six months ago because of what I see in this ng, on the mailing lists, in FidoNet, and from users in general.

That article has no credibility.
Whilst it's fair to include the Atari they totally ignored the Amiga
achievements. The first multitasking GUI on a home computer surely deserves
a mention, doesn't it?

All,
     Speaking of the Amiga, Gateway has announced that they are working on a
new Amiga computer. OS 4 will be a tempory OS for software companies to
build apps then when the new machine hits the streets next year, it will
have OS5. They said that this machine will be better than any consumer
PC available.

Gateway actually haven't announced anything (AFAIK) but Amiga International
have released those details. They do have full support from Gateway
however, including substantional financial support.
PPC has been dropped in favour of an as yet unavailable CPU/Processor which
supposedly will feature a programmable instruction set.
The new system due in 1999 will be 5-10 times faster then current PII
400Mhz/100Mhz bus systems.
OS 5.0 will be the OS running on this system, with the developer OS 4.0 and
machine (Amiga/PC hybrid) released later this year to allow developers time
to develop applications for the new system and to have them ready when the
new machine is officially released.

Current PPC upgrades will continue to be sold and supported with the
manufacturers of these boards (finally) working together to support the
Amiga community until the new machine is available.
The OS 3.5 upgrade has been cancelled by AI.

With Gateways backing the Amiga could once again be a viable platform.
Besides, we must be due for another platform to kick the shit out of the
current Mac and PC systems. How stale can it get ?.

Regards,

Clockmeister.

Yes, but only if the the system is open and if people are eventually
able to build one themselves from modular components as well as use
industry standard cases, video cards, etc. etc. I don't care WHAT
cool things they put in it if it is going to be another eighties
style closed up box that can only be minimally upgraded with
manufacturer supplied parts.

Apple will yet die of this disease. We don't need another carrier of
it.

If you ask me this new computer doesn't realy sounds like a Amiga at all. It will
only be compatible with old amiga apps through emulation. The OS will be
completely
new and based on a outside developed kernal like BeOS, or Mach. This you can
already
be done under Linux. It will not include a Motorola CPU, it's probably going to
use
intels comming Merced chip, or something else shitty. The "new" amiga which will
be
like a bridge to the new platform which will be released later this year will be
based
on the Pentium, so it's clear that they will go for the x86/intel line like

everyone
else. Don't forget that Gateway has only made intel boxes and never even seen a PPC.

Basicly it's a completely new computer and OS with the Amiga name on it. It's like buying a PC whith the Commodore sign on it. It has got nothing at all to do with Commodore.

What about the Digital Alpha work stations?

That are real computers! After an 8 bit spectrum and a 16/32 bit
Atari it is time to scale up again. Not to a lousy 32bit system. That
was interesting 10 years ago. Nope, time to get 64 bit hardware, that
is progress!

The Alpha processor is for serveral years the fastest processor
available. The newest stuff if quite expensive. But if you go for
the outdated stuff you get a good price. Outdated are:
300-400MHz 21164 processors, they come typically with 96kB
2nd level cache and 1Mb 3rd level cache.
(My system, 300 MHz Alpha 21164, 1MB cache, 64MB RAM, SCSI CD ROM,
1GB SCSI harddisk, Matrox Millenium graphics card and ethernet
network was about NLG 2500 or about 1250 US$, half a year ago.)

Take as OS Linux and you have some real computing power on
your desk.

Bye, Hans

Is the latest Alpha 5-10 times faster then a PII 400Mhz/100Mhz bus ?.

In all the projects I have used the _hash function in (see my CPXs on my web
site) I know what the data file is as I construct it :-) and I run it through
a test program first to make sure that there are no duplicate hash values.
I've no idea what algorithm they chose but so far so good :-)

Apple has been around for over 20 years. That's a long time for a
computer manufacturer. I don't think they'll be disappearing any time
soon.

Are you saying that if a new ST was released it would have to be 100%
backward compatable with the old eighties designed hardware ?.
Emulation is a great solution for backwards compatability.

> new and based on a outside developed kernal like BeOS, or Mach. This you
can already

The kernal will "borrow" parts from other OS's, a lot of the features of
workbench will be retained and enhanced further.

> be done under Linux. It will not include a Motorola CPU, it's probably
going to use
> intels comming Merced chip, or something else shitty. The "new" amiga
which will be

Definately not Merced or anything Intel.

> like a bridge to the new platform which will be released later this year
will be

like everyone
> else. Don't forget that Gateway has only made intel boxes and never even
seen a PPC.

Gateway wouldn't pay $40 mill for a virtually dead platform with only a
small user base and then spend money on redevelopment to sell rebadged
PC's. Who'd buy them ?, Amigans certailny wouldn't and neither would Joe
Blow.

>
> Basicly it's a completely new computer and OS with the Amiga name on it.
It's like
> buying a PC whith the Commodore sign on it. It has got nothing at all to
do with
> Commodore.

It's for real dude, and it's an Amiga and it's not a PC.
I can't see a PC being 5-10X faster then the current PII by end 1999.

Besides, what the hell is the problem with having another alternative to
Intel ?.

Sour grapes ?
:-)

Regards,

Clockmeister.

The Alpha 21264 is, esp. on the floatingpoint part. Integer
specs are a bit less. And this processor is shiping now. It's
not some magical vapor ware like Intel Merced or a 'quantum
processor' to be released in 1999. It is simply the fastest
processor available.

Bye, Hans

And it's not a Amiga.

> I can't see a PC being 5-10X faster then the current PII by end 1999.

5-10x times faster than what? A sluggish 266MHz P2, or a 400MHz? I wonder
how they define "todays PCs"?

And which is this mysterious CPU?

> Besides, what the hell is the problem with having another alternative to
> Intel ?.

Nothing! Did you say that?

> Sour grapes ?

For what? I think you have missed something obvious and the funny thing is that you doesn't even know it.

The current Alpha (available since last year) is 4-7 times as fast
as a P2. Next one out next year will be between 8-15 times as fast.

I have decided to release my program Zorg as a freeware under GPL.

The archives are on ftp.lip6.fr in /pub/atari/Incoming and should be
moved to the Disk/ directory soon.

The files are:
- ZORG_210.LZH for the binary without any limitation
- ZORG_SRC.LZH for the sources (Purce C 1.1)

If someone wants to continue the developpement please contact me.

Questions and/or answers by mail as I have no time to read these
newsgroups.

Newsgroups: comp.sys.atari.programmer,comp.sys.atari.8-bit

I've provided a lot of Atari system info to people who worked on emulators then stopped. Finally, the Atari800Win is out and there's good reason to get to work on this myself.

Since I haven't been able to find it out there, I am going to work on a programme to allow the PC to read Atari disks so that the data can be saved. I need ANY info you might have concerning this project. Info on programmes such as MacDrive95 would also be useful, since that programme hooks into Win and allows the PC to read/write/format foreign (Mac) disks.

The programme will probably work under DOS and may use an older version of MS or IBM DOS, like 6.0, 5.0 or even 3.2. Transfer will also probably only be to the 3 1/2" floppy to avoid having to deal with the hard drive and the FAT16/32 and long names systems.

I and my partner were the largest Atari software and hardware err... "experts"... in the '80s and are both interested in making a lot of the now-defunct software available for archival purposes (standard MAME-type disclaimer here). He also wrote a couple special "mini-DOS"es to load multiple programmes/cartridges (we placed many on diskettes) and we'll make these available for the emulator, too. We have more than 3000 (no typo) disks, both boot and binary files, that we want to save. Many are already being lost to aging.

As further temptation, we have most of the cart games/programmes in

binary form and also have a lot of the languages and boot games. Oh...
we also have all the 5200-to-800 conversions (and the source code AND a
way to convert all the new 5200 images that are out there to 800).

Your help is greatly appreciated.

Respond/reply to bad_doggie@hotmail.com please.

Cheers-

m w grossmann

Titanic was officially render on Alphas running Linux.
Amiga can probably do that, they did an great job in babylon 5, but the
Titanic team decided to use Alpha/Linux combination.

Hi,

I am looking for some brave souls to try out a Perl 5.005 beta
release on MiNT.

Background: a guy called Guido Flohr did the port for an earlier Perl
release last year. I now upgraded his patches to the current Perl
5.005 beta -- but Guido isn't answering his email (maybe he is on
vacation or something) and I don't have MiNT to test the code on.

So, if any of you kind people who have MiNT and some time to spare,
could you please grab

    http://www.iki.fi/jhi/perl5.004_69+mint+mpeix+mvs.tar.gz

and give it a good MiNTing.

Note that some experience in Bourne shell scripting, C programming and
debugging, and the Perl language itself may be needed to get 100%
"make test", depending on how badly I botched up Guido's work...

Having built Perl on other platforms would be also a definite plus
because then you probably don't need to read the "INSTALL" file and
you know what "running Configure" means.

Oh yes, I forgot to say, please contact me directly at jhi@iki.fi if
you have any questions or comments, a newsgroup is not a good place
to conduct code development.

And what will they die from? I guess you have not been keeping up with the
happenings in Cupertino lately.. With the imac on the verge of being released
and continued high G3 sales moving forward, what more could you want?

Peter S.

They did a great job on the first *FEW* episodes of B5, but they went to more
powerful equipment later. Also, it was an Amiga coupled with the Video
Toaster, not just an Amiga alone.

The article was from First! by NewsEdge Corp. You can find them on
http://www.newspage.com, but that was several weeks ago.

The were using some of their own programs. I cannot recall what's the name of
the program.

This will work to replace EXIST() i gfa.

```
FUNCTION exist(p$) !v0.05
  $F%
  LOCAL r!,e&
  p$=p$+CHR$(FALSE)
  ~GEMDOS(26,L:BASEPAGE+128) !set dta
  e&=GEMDOS(78,L:V:p$,W:FALSE)
  IF e&=FALSE
    r!=TRUE
  ELSE
    r!=FALSE
  ENDIF
  RETURN r!
ENDFUNC
```

I would think that the Alphas only did the rendering, so it shouldn't be to hard
to
port a
renderer to it. The editing probably took place one something else.

I guess you could use a C64 if you ported POV to it, so who cares? Anything
with a CPU could do it.

     The point was: Amiga can ALREADY run the OS an necessary
     support tools. All D2 would need to is to copy them over
     to the Amiga farm and re-run make.

Darkie (from Algonet/Tninet) <mailto:*****@******.**> sent a 5 line-long
message in comp.sys.atari.programmer called "STOS Compiler" saying:

>Where can i find it?

I think you get it with STOS itself. Either way you should be able to
get it from any good PD library. (It's called COMPILER.ACB, ran in by
hitting HELP)

Another explanation could be that they did not quite implement what was
specified by Ken Badertscher, Atari. I do not know who was first, but Atari
had the rights to do the specification, so that is the only valid one.

Do you allocate memory, and keep it allocated for any significant time ?
Or do you keep files open for any significant time ?

Since under singleTOS all main application and accessories are the same
GEMDOS process, both will lead to serious trouble, possibly what you've
observed. Particularly the dependency on running a program will show up.

Cheers Peter

```

This exemple work fine for STDOUT but most software use STDERR
(handle=2), the redirection is the same for most systems but don't work
with MINT.

Yeah, I have heard about it before. The solution is to remove the
RAM checking for now or get a AB040 with Fast-RAM. :-)

> Could you take a look?

Maybe..... as it's far from finished anyway I would not recomend anyone
to use it. I'm not sure I will ever finish it either as I don't realy
use it my self. Do you actually use it or did you just try it?

I would not think so either as it's taken straight from one of his sources
and contains lots of more or less usefull stuff.

> no objection to distributing my D'n'D routine... hmm... actually, they
> are already distributed I think as IIRC GEM-DEU has the routines...

AFAIK GEM-DEU can only handle a drag'n'drop message, not create it.

There is a Libary called Gem++ which is a Gem Libary for C++. it looks good.
I personaly have not yet tried it.

Hi

I've been using some assembly code from Jon Ellis (ST Applications article) which determines the type of 680x0 CPU it is run on. Up till now it worked well but recently it fails badly (causes a 4 or 6 bomb crash) on a new Veloce+ 68020 add on board for a ST from The Upgrade Shop.

Jon doesn't seem to be around any more so is there any one that may look at the code for me and check it over. It's in Lattice C assembler format but that shouldn't matter too much only the C interface stuff.

Also, any one with a 68020 add-on who might run a little test program for me to see if the problem is specific to this one board?

Many thanks

Slainte mhath

Ah, yes, you are right... well, in that case I have more than is in GEM-DEU. :)

Actually, it was sold seperately (it wasn't finished when STOS was launched).

> Either way you should be able to
> get it from any good PD library.

Do you feel like nameing a few? ....officially, STOS is not PD.

> (It's called COMPILER.ACB, ran in by
> hitting HELP)

It also needs the contents of \compiler\ to work. And once you have a
copy of the compiler, download my patched "207beta2" as it fixes a few
bugs, in particular compatibility problems...

I wasn't so much refering to the endianness of the processor, although I
did get this wrong in my original post. I was really interested in knowing
the order in which words will be physically transferred over the data bus.
If I make a more concrete example it might clarify things:

The DMA chip has two 16-bit registers located (IIRC) at $FF8604 and
$FF8606.
  $FF8604 is the data register
  $FF8606 is the control register

The contents of the control register affects what value is currently
available in the data register. Normally, you would access these registers

as follows:
  move.w #select_data_register,$FF8606
  move.w #write_data_register,$FF8604

But could the two instructions be compressed into a single one, such as:
  move.w #(write_data_register<<8)+select_data_register,$FF8604

Ie, will the single instruction first select the correct data register,
then write the data, or will it write the data using the previous settings
and then select a different data register.

TOS 1.00 uses such an optimisation, and I need to know whether it is a bug
or an intended feature.

The cpu will write out the value with increasing addresses when talking to
a narrow port. This is true for all 68000 variants with dynamic bus
sizing.

|> TOS 1.00 uses such an optimisation, and I need to know whether it is a bug

This is guaranteed to work.

I have converted my latest game to work on one meg machines which you
can get from my Atari Page. It works under Pacifist but I couldn't get
it to play the samples under V0.48. Note if you downloaded the old two
meg version then you will have to re-download all the zips files for
the new One Meg version to work.

Hello Roger,
> Use a DOS manual. The syntax is practically identical.

Yes, I noticed that, but look at the following (it's Atarirc's install.bat):

```
STiK's IRC-Client (PRG/ACC-Release)
$mkdir @DOC
$mkdir @DOC\ATARIRC
$mkdir @ATARIRC
$copy atarirc.app @atarirc\atarirc.app
$copy atarirc.rsc @atarirc\atarirc.rsc
$copy atarirc.doc @doc\atarirc\atarirc.doc
$copy changes.txt @doc\atarirc\changes.txt
```

If you run it, it gives "Kommando night gefunden" for each line under Magx shell.
See those "$" and "@", probably to disable the commands? Seems there is a convention as I've seen it in other batches. And if there is, I'd like to know more about.
Bye !

The same trick is used for programming the soundchip,

$ff8800 is register select
and
$ff8802 is write selected register
lots of programs using the soundchip use a long to select a soundchip
register and write data to it. i.e.:
    move.l   d0,$ff8800

The 68000 will write, in compliance with its spcifications, first to the
lowest adres and then the higher adresses. This is also true for
move multiple instructions.

Hans

Hello there!

Crown of Creation 3D, the ultimate space-action simulation for the Falcon030, finally got its own homepage!

After the overwhelmingly positive reactions of many players and magazines, now the latest facts on this standard-setting game can be accessed via internet.

Simply go to http://www.tu-bs.de/~y0001569 to see this:

- The story
- The features
- Test reports
- CPU-/DSP speeder support
- Online order CoC 3D
- Get the latest updates (V1.3b)
- Screenshots

All pages in Deutsch/English.

See you soon!

Hallo,

mich interessiert stark, ob mein Junior-Prommer (Maxon) auch an einem
PC betrieben werden kann.
Wenn ja, welche Software w?re dazu geeignet bzw. zu welchem Modell ist
er kompatibel (Quickbyte 2.0 Eprommer, Eprommer der Fima
REX-Datentechnik)?

Hat damit schon jemand Erfahrungen gesammelt?

Besten Dank - M.M.

You can't, atleast not legally. Since you can't specify what
VDI-workstation objc_draw() works on, it will only draw to the device
that the AES use (i.e. the screen).

Why dont you use a CSH shell giving a CSH scrpit ?
Making a small executable who will launch this script sould
not be complicated, this sould be easyer to make because
you'll have all the documentation you'll need, and more
over this could run an a simple ST under single task TOS !

Looking for a Mega ST main board with minimum 2Mb
email cost of board plus mailing/shipping costs
mailing address is below to calculate shipping cost
I live in Canada will pay via international money order

Thanks,
Charlie

Newsgroups: comp.sys.atari.programmer

Hi everyone,

I finally got VA_START working with the following:
pointer = * ((char **) message + 3)

(thanks guys!)

Surprisingly, when I display it in a window info line (wind_set (wid, WF_INFO, pointer)), I get a Pascal string: there is a "prefix" caracter, for exemple the bell (ascii 10) if I drop a 10 caracter filename on my prog.

So my question is: is the VA_START message is in Pascal format? The few docs I have don't mention that. I tested with Magxdesk with or without AV_SERVER, and the results are the same.

Hi!

I'm trying to change font in a userdef, but for some reason it doesn't work.

Even if I do something like:

```
  vst_font(vw, fontid);
  v_gtext(vw, "some text");
```

...the text is always written with the system-font. I *know* that the font-ID is correct, and that I use the correct virtual workstation-handle. Is there something obvious I'm missing? I have no problems in changing fonts in other parts of the same program.

I have a problem...
I compiled a program and while I was testing it, I noticed that the rand() function wasn't working. So I tried it by itself in a seperate program. It worked!
Anybody any ideas as to what's happening?
I was using C68k on a 4Meg 520 STe, if that helps...

Thanks in advance,
George Shore.

You might want to check to make sure you are definitely opening your own workstation (via v_opnvwk()) rather than simply using the AES's workstation, as returned by graf_handle().

But why do you want to use a USERDEF ? You can use a normal text object with the voctor font attribute ! It works well with AES up to 4.0, and it draws a system font in others... and you can edit your RSC file with the patched Atari's editor.

Newsgroups: comp.sys.atari.programmer

Hello,
  I have a mini-project to turn a STfm into a video titler machine feeding a video projector (via the built-in composite video output!) for a sing-along application. Right now, I am using Degas Elite to create slides of the verses, and the SHOWPIC2 program that came with Degas to put them up.

The problem here is that SHOWPIC, like all the other slide show programs I have seen, simply picks the files off the disk in the order they were loaded on and displays them automatically, with an option for manual pause. There is no opportunity for starting at an arbitrary point in the sequence, or for going back to a slide if you made a mistake and unpaused too quick. Furthermore, if you have a bad slide or data error, the show is over, since there is no other option for recovery than starting from the top.

What I would like to see is a program that displays Degas PC1 slides, using a text list of filenames that can be arranged externally with an editor, with advance or backup via the up and down arrow keys. Furthermore, the list can be brought up for the user, say via the Esc key, and a cursor moved up or down (note: no mouse required) to pick an arbitrary start point.

This doesn't really sound too tough, and if I were closer to picking up ST programming, I might try it myself. But since my requirement is NOW, I would like to ask

1) Does this sort of program already exist somewhere? If so,
where can I lay my hands on it?

2) If it does not, do any of you hacks want to take a quick go
at it?

Do you have the segment of code that uses it? That would help even more.
Also, what do you mean by "rand() wasn't working"?

Ok. Here it is:

```
double frand(double x)
{
   return fmod((rand() % 100) * .01 + rand() % 10000, x);
}
```

> Also, what do you mean by "rand() wasn't working"?

What I meant was that when it was called, rand() wasnt giving me a random
number but always 0, and when I tested rand() out by itself it was. Sorry
about my vagueness. :-)

Hi,

I compiled this program in Pure C and it is working good:

```
-------------------8<-----------------------------------

#include <stdio.h>
#include <math.h>
#include <stdlib.h>

double frand(double x)
{
   return fmod((rand() % 100) * .01 + rand() % 10000, x);
}

int main(void)
{
  int i=9;
  double x=12.34;
  do
  {
    printf("%i frand(%lf) = %lf\n",i ,x, frand(x));
  }
  while(--i>=0);
  return 0;
}
-------------------------->8------------------------
```

Bye, Hans

It seems like it should work. This may be a dumb question, but do you have any other functions named "rand()" that may be getting linked in? Aside from that, I can't think of much else...

There's also the apparent lack on an srand() call, which might cause
problems. From the docs I have, it looks like the default seed value
should be 1, but that may not be standardized. It is possible that the
algorithm used in rand() will return all zeros if the seed happens to
start at 0.

On another matter, are you using a 16 bit compiler (like PureC)?
If so, the return value from rand() is most likely 16 bit and then it
looks to me like the %10000 wouldn't be a very good idea.
The maximum number would be 32767, which means that there are four
possibilities for 0-2767 to occur, but only three for 2768-9999.
There would still be a skew in the probabilities if you have 32 bit ints,
but then it would be very much smaller.

Another thing to remember about 'random' number generators is that the
number as a whole is usually a lot more 'random' than the low order bits
(rand() % 2 might give 1,0,1,0,1,0,...), but you should not be running
into that here.
I've seen some very funny effects of this in image processing software,
such as pixel spreads that tend to go mostly right and down and 'noise'
with very obvious patterns.

IIRC, True ASCII is a 7-bit code (0-127), which means
you won't find any byte-sized values larger than 128
anywhere in the file.

Actually, it's owned by the AES itself, but the end result is pretty much
the same. Trivial, I know! :-)

Bonsoir,

Dans l'article <357cb2f2.1267961@news.tmisnet.com>,
George Crissman, <strads@tmisnet.com> a ⍰crit :
>IIRC, True ASCII is a 7-bit code (0-127), which means
>you won't find any byte-sized values larger than 128
>anywhere in the file.

Not at all reliable for any other language than English... As I don't want any program to reject my French texts only because I use accents (all coded after 128), please FORGET THAT RULE...

Even if, in fact, pure original ASCII defines only codes on 7-bit... That's history now. Present is ISO codings (8 bits or more...).

Afaik the only C++ compiler for the atari is the Gnu one. I've never
used it myself although from what I've heard most folks who use it
tend to do so from a unix environment (which is called MiNT for
machines with lower spec 680x0 processors).

I guess it would be possible to get it running under a suitable
command shell but again I've never tried. Hopefully my reply will give
rise to some more useful responses!

This is correct but there's one small point: the text file might not
be in ascii. ;-)

The easiest way, IMHO, is to do as follows:

pointer = *(char **)&mesag[3];

That is, take the address of the fourth array element and use it as a

pointer to the character pointer we want to get.

Maybe by making a connection with the parallel interface from ST, I

need some software that can emulatie the Computer serial signal, must
not be so hard because the ATARI ST XFORMER was able to read floppy's
with the parallel cable from the ATARI 8-bit 1050 drive and that runs
at the same speed as the computer that send serial data to the rs232c
interface 850. Max. 19.200 bps ASYNC....

The game is finished apart from a couple of small bits such as title
screen and intro. This version of the game has been uploaded for
testing purposes only. If you would like to test the game then go to
http://www.users/zetnet.co.uk/sillysoftware/playtime.htm

There are five zips files to download but none of them are more than
500kb. Note, once you have downloaded the first four then you will
only need to download the fifth (MAIN) when the game is updated.

Full instructions are in the file info.doc

Note: I couldn't get it to run under Pacifist v0.46 or v0.48, if
anyone can please let me know.

 Well, I have almost zip experience with 'The Old Ones', so I'll leave that
 to the techheadz. However, it's a nice idea, and it would certainly be
 great if you could use the parallel port as a serial port. What would
 be fantastic, is when someone would write a Mint extension to use the
 printer port as a serial device. Then all your worries should be over.

: Now, you will see I did....

 Well, here are some details : I had one regular Falcon as the server. It
 has Mint 1.12 and MintNet installed with KEMD rev 2. Check out :

 http://www.primenet.com/~kellis/

 It ran SMTP (mail) and FTP, and NCSA httpd 1.3. I installed a huge existing
 website on it, and it all worked well (clients connecting with CAB). To
 connect the clients, I used SLIP connections, because PPP did not work.
 The clients were : Apple Powerbook with MagicMac, MEGA ST 4, and a
 boosted Falcon. All worked well, except the LAN port on the Falcon did
 not work with the SLIP. Terminal connections are *no* problem. I tested
 that with Connect 2.46

 If you have any specific questions, fire away.

 Greetz,

*********************************
*    PHENIX 040® Workstation    *
*      FIXED FEATURES V.1.0  <-- YEAH !! *
*********************************
```

® MAY 1998, CENTEK

This computer is NOT a TOS clone or a PC compatible !
It is a NEW computer including NEW HARDWARE and NEW OPERATING SYSTEM named DOLMEN®.
A software EMULATION support into the system allows to run softwares from the old operating system named TOS®.

- MOTOROLA® MC68040® at 40 MHz (BCLK).
  NOTE : The 040 instruction execution units are CLOCKED by the BCLK and NOT the PCLK (80 MHz) - See Section 10 page 10-4 of the MC68040® DATABOOK (M68040UM/AD Rev.1) and our technical files on this site !
  By example : - Afterburner® is a 040 at 32 MHz !
  - Hades® 040 is a 040 at 32 MHz !
  - Milan® 040 is a 040 at 25 or 33 MHz.
  People who present the 040 as a x2 (i.e 64 MHz) clocked processor are liars !!!
  CENTEK refuses to use the same 'commercial' politic !

  - Can be updated with a 060 at 80 MHz (BUS at 40 MHz).

- BUS : 32-Bit DATA / 32-Bit ADDRESS / 40 MHz Frequency.

- Three SIMM sockets : 32-Bit RAM up to 192 MB.

- MOTOROLA DSP 56301® at 80 MHz (80 MIPS !).
  - 24-Bit HOST port with 3 clock cycles access :
    80 MB/s DMA transfert (or 26 MWords (DSP 24-Bit words).
  - On-Chip Memories : - 2048 * 24-Bit X Data RAM.
    - 2048 * 24-Bit Y Data RAM.
    - 3072 * 24-Bit Program RAM.
    - 1024 * 24-Bit Instruction CACHE.
    - 192 * 24-Bit Bootstrap ROM.
  - Off-Chip Memories : 384 kB 15ns SRAM (=128 kWords 24-Bit).
  - External DSP connector (Falcon signal upward compatible).
    - HD SUB-D 44 pins.

- MOTOROLA MC68360 - QUICC® at 40 MHz.
  (QUICC® : QUad Integrated Communications Controller).
  - CPU 32 Core (68030) - 7.2 MIPS at 40 MHz.
  - 32-Bit DATA and ADDRESS lines.
  - Four General-Purpose 16-Bit Timers.
  - Sixteen 16-Bit software Timers.
  - Two Independent DMA (IDMA) with Single Address Mode
    (up to 80 MB/s at 40 MHz per DMA channel).
  - Communications RISC Processor (35 MIPS @ 40 MHz) with 14 DMA
    channels :
    - Ethernet/IEEE 802.3 Optional (Full 10-Mbps Support).
      - A motherboard slot is dedicated for this option.
      - 32-Bit DMA transfert.
    - RS-422/GeoPort® up to 4 Mbit/s full duplex.
      - Mini-DIN 9 connector.
      - LocalTalk® and AppleTalk® backwardly compatible.
      - 6 kV ESD protection.
      - 32-Bit DMA transfert.
    - RS-232 up to 1 Mbit/s.
      - Standart SUB-D9 conector.
      - 15 kV ESD protection (European standart).
      - 32-Bit DMA transfert.
    - Full CENTRONICS® IEEE 1284 parallel port.
      - Up to 4 Mbit/s half duplex.
      - 32-Bit DMA transfert.
    - TWO MIDI (In/Out/Thru) channel.
      - DIN-5 standart connectors.
      - 32-Bit DMA transfert.
    - One SPI® channel.
      - The 3 pins are on the DSP connector.
      - 32-Bit DMA transfert.

- THREE 8-Bit ADC channels for external DATA acquisition.
    - The pins are on the DSP connector.

- PCI® controller : - MASTER and SLAVE.
      - Two DMA channels (up to 132 MB/s).
      - PCI 2.1 compliant.
      - Support of the PCI 3.3v signaling.
      - Support of the I2O® new PCI messaging.
      - Two PCI slots.

- USB® controller for 2 HOST USB connectors :
    - 32-Bit DMA transfert.
    - one is used by the keyboard.
    - the second is available for all the USB peripherals...

- 128 kB FLASH Eprom containing the BIOS (SET UP/AUTOTEST/BOOT).
                The FLASH enables the software updates.

- ULTRA-SCSI bus (SCSI Controller with 16-Bit DMA) :
          - The SCSI bus maximum rate is 20 MB/s.

- The HOST DMA maximum rate is 40 MB/s.

- VIDEO : S3 VIRGE DX with 4 MB of EDO RAM.
  - This card occupies one of the two PCI slots.

- SOUND : You can choose a card between :
  - Stereo 16-Bit 33/44.1/48 kHz :
    - 2 CINCH Inputs / 2 CINCH Outputs
    - 1 Mini-Jack for a microphone.
    - 1 PC compatible GAME port
    &
  - Professional 24-Bit 48/96 kHz Card including :
    - 8 INPUTs / 8 OUTPUTs, SPDIF®/AES®/EBU® Interface.
    - 2 others MIDI channels

- VOCAL : TI® Speech Processor for the
  Speech Recognition, Speech & Music Synthesis,
  Access Control, and Software ONLINE HELP !
  ** This feature will be fixed later **

- TIME : Timekeeping® module with 242 bytes of NVRAM (Non Volatile
  Ram) with RESUME mode to Wake up the PHENIX®.

- SLOTS : - Two PCI slots (one is used by the Graphic card).
  - One DIRECT 040 Processor slot for Hardware expansions :
    - others CPU (040/060) card.
    - PowerPC® card (to mute the softwares to .....)
    - others DSP 56301 card.
    - VME® bus.
    - Memory adding card (up to 256 new MB).
  - One AUDIO slots (it is used by the Audio card).

- KEYBOARD : USB Keyboard !!
  - This one may be a KEYTRONICS® Natural® keyboard.

- MOUSE : PS/2 mouse.
  - it is connected to the USB® keyboard.

- CASE : Standard Middle ATX 2.0 Tower.
  and CENTEK desktop case...later.

- POWER : ATX 2.0 compatible.

- OPERATING SYSTEM : DOLMEN®
  - Multi-tasking
  - 100 % 040 ASM code !
  - AES & VDI backwardly compatible.
  - The VDI uses all the 2D/3D S3 VIRGE® functions.
  - Easy to update by the Flash and the HD.

****

I think the best way is to determine the ratio of the characters 10, 13,
the characters between 20-127 and the total character count, if it is
about 80% or more you can be pretty sure to have an ASCII file.

-----BEGIN PGP SIGNED MESSAGE-----

While writing a program to convert upper case filenames to lower case, I've
come across a problem with Magic. According to the programmer docs, Magic
supports the ARGV format for extended command lines. The trouble is, when I
do a getenv("ARGV"), I get a null pointer, although a getenv("GV") returns
the correct ARGV list. What appears to happen is the ARGV=... is turned into

A[NULL]GV=... which breaks the search.

What I want to know is, is this a fault with my installation, or is it something wrong in Magic itself? Anyone else have a problem with this, or even noticed it?

I'm using Sozobon C v2.0, DLibs v1.12 (with a few extras), Magic 5.11 and a 4Mb STE, just in case any of these have any bearing.

Anyone got any tips on how to add support for 'drag and drop' under Magic? I've been trying for over a week to figure out how it's done, and finally given up with the VA_? messages, as Magic doesn't use these to let my app know about it. I've got as far as figuring out that a message (63) is sent when a file is dropped on the window, but I don't know how to handle

it.

BTW, I've tried using the Magic 5 programmers docs, but I can't read German
and the translation makes only a little more sense.

Ah but it made me think of a question so perhaps not! ;-)

Any idea if things would still work ok if the acc set p_run to its own
basepage? I've always wondered why someone hasn't dreamed up a
workaround for this problem.

It works just like under MiNT. ;-)

Seriously, it's not very hard when you have figured it out. It's explained

in the compendium and probably somewhere else. I have got sources for it
right here which I got from Erik H⍰ll. I could mail it to you if it's
alright for Erik or you could ask him your self. He is always very helpfull.

hi magnus, I have found a bug in your MDESK it seems.
Ran from a falcon 14meg of STram and NO TTRAM. If the RAM option from
the mdesk.inf is set to TRUE (or ON whatever), it will just crash.
At first I thought it crashed because of some bug in the windowing.
but it really seems it comes from this TTRAM checking thing.
Could you take a look?
Thanks

Hi, I have made this prog, has been developed under mint and made FOR
mint. however I noticed that it could be used from singletos as I
didn't access any Mint specific routine.
Well, in short, I tried it under singletos with the aes of my falcon,
it will start fine, I open it, I use it fine, but if I close it, OR
run a prog, then it is all messed up, It won't open anymore. Will use
some cpu time (like if it was running, but I can't see it running)
etc.
The weird part is That this is NOT an OS related problem, but really
an AES. As IF I load gem.sys (aes 4.1) for example, STILL under
singletos, my acc will run fine. (oh yes my prog is an acc).
If ran from MiNT and aes 4.1 or naes, it works fine.
If even ran from Magic! it will runs perfect.
SO, my question, am I hiting a bug (known?) that was in all aes <4.x ?
If, yes which one? how to avoid it?

Lemme recap quickly: The prog is an ACC.

singletos (old aes) > crash
singletos (new aes) > good
all multitasking(mint, magic) > good
didn't try under geneva, so I couldn't tell.
Thanks.

The AES will on every window redraw look at the pointers given to where
these strings are supposed to be. Therefore the addresses provided must be

longterm stable, in other words the strings must be either in a malloc area, or in an INLINE or stored in a numerical array which is known not to move about at runtime (i.e. DIM'ed early at startup with nothing later deleted from "underneath it").

(I would guess that you simply passed the value V:a$.)

Yes, it works fine. That's exactly what I do in several DA's I've written. This not only solves the problem of memory getting deallocated when the main app quits, it also keeps file handles from being closed in the same situation.

Just a reminder: don't do this if there is multitasking of any sort.

I've been doing that for some time now. Just remember to set it
back again.

I used to check for multitasking by comparing *p_run to the current
basepage. Later I decided that it was faster just to reset it.
While *p_run may be volatile, under any form of multitasking it will
always contain your basepage WHEN YOU ACCESS IT.

The first thing you need to do is find out what AES command is

causing the crash, either using a source level debugger or by
inserting form_alert()s to narrow down the bad section.

It is likely you are using an AES command not supported for early
TOS versions (e.g. fsel_xinput).

Yes. WF_NAME and WF_INFO just store the pointer to the string, not the
string so never use local variables for the string.

There is also another issue which came to light not long back. It is wise to ensure your strings do not exceed about 200 chars as this can cause corruption also.

I while back I was asking about a way to do this subject.

I have though of a way but was wondering how "clean" the idea is.

you can find out the w and h that your window needs to be with a
wind_get() call, cant remember the number.
Using this information could you do something like,

```
for(int x=0; x<max_X ; x+=width of an iconified window)
{
  if (wind_find(x,max_Y)==0)
    {
      x2=x;
      x=max_X;
    }
}
```

so that x2 will point to place to put your iconified window?
The y coord to place it at being calculated by,

y = max_Y - height of an iconified window

you then use wind_set() to iconify it to the calculated position.

I've not actually got around to testing the above so it may not even
work.

Whoops, forget it.
I forgot about other windows covering any iconified ones!
That'll teach me to post so late at night.

So it is enough to check global[1 iirc] (concurrent process value) in
order to determine if fiddling with p_run is necessary?

```
if (global[1] > 1) /* dont fiddle */
else          /* fiddle */
```

If this is the case then I might knock up a workaround for others to
use.

Generally speaking, the older the Gem version the more sensitive it is. Worse still, the problem has a habit of 'persisting'. By that I mean you could have a bug in your development program which upsets Gem slightly. You can then mess around for the rest of the day changing the source - only to find you'd fixed it hours ago and Gem is just mucking you about. With singletasking Gems I'd always advise a reset between runs on a buggy prog. It's a pain but there's no other way.

>Lemme recap quickly: The prog is an ACC.
>
>singletos (old aes) > crash
>singletos (new aes) > good
>all multitasking(mint, magic) > good
>didn't try under geneva, so I couldn't tell.

I'll start with the obvious one. Is Malloc etc being used?

Next most likely culprit is your window. Gem is none too forgiving about you attempting to open a window which is already open or closing one which is already closed. This is one of those things which can 'upset' it as described above.

Another thing is doesn't like is you pumping data into the message pipe so that it overflows. SingleGem has a very small message pipe compared with the multitasking versions and there is no way to detect if you've overflowed with its version of appl_write. If the window size isn't within reasonable limits then expect it to sulk also. Null/silly pointers for the WF_NAME and WF_INFO lines are good for a laugh [not] as well. Check the code isn't getting stuck in evnt_multi etc.

Dunno how it manages to do it so often but SingleGem has a habit of managing to corrupt your code when it's in a mood. If you get really desperate, move your functions around in the source code [or otherwise cause the linker to rearrange the object code] and see if there is any difference in behaviour. If there is, track down the function being corrupted. Print its address and start hunting for data pointers with value in or below the TEXT segment.

Finally, if the darn thing works fine when using a debugger, then you're almost certainly looking at a memory leak.

One last thought: 'multigem' may not mind you issuing wind_close in an

Acc after AC_CLOSE but singlegem probably will.

I've noticed inconsistencies with ARGV. It was invented by Mark
Williams Company and formed part of their compiler. The docs are

reasonable upon this matter and the runtime startup sources (asm) are available also, making the matter abundantly clear. Unfortunately, what Mwc invented was not quite what got implemented. I have no idea if someone misunderstood the Mwc ARGV implementation (understandable) or decided to improve upon it (unforgivable), or just never knew Mwc had already implemented it (unlikely).

I decided to write another Mwc startup which used the implemented ARGV and found like you that MagiC/Ease was doing something different yet again. It seems there are at least 3 different ARGV implementations. This alone was reason enough for me to forget ARGV until someone could explain why. No-one has yet!

For those tempted to jump in half cocked ... ;-)

This was quite some time ago so I can't remember the technicalities. Aside from that I've no interest in getting into a "this ARGV is better than that ARGV" debate. All I'm interested in is hearing if the matter gets resolved. Here's the Mwc runtime startup for perusal ...

```
/
/ ST C run time startup.
/
     .prvd
     .globl   errno_

Try doing similar but scan through the window pile instead, ignoring
those windows which are not the size of an iconified one.

Yeah, and I wrote this at 05:57 as well. Typical innit, got a long day
ahead so I wake up at 3:30 in the morning!!!

I haven't got the compendium, although I sometimes wish I had. I've had
a look for some MiNT docs, but haven't found that much as yet.

I haven't got Eriks email address, so if you can let me know, I can ask him
for it. That is if he hasn't already said it's okay.

Well if Erik doesn't want to distribute them (unlikely) then I have
no objection to distributing my D'n'D routine... hmm... actually, they

are already distributed I think as IIRC GEM-DEU has the routines...

well, anyway, I've been meaning to put these (with some explanation)
on my WWW pages, so if you want them just shout.

Anthony

Hi everyone,

I've noticed some applications, CAB and Atarirc for example, come with

install.bat files.

Where can I find docs (in English if possible) on the way batches must be
written ?
Thanks.

I have finally released Mummies Playtime, and you can download it if
you go to my site from my Atari Page. It needs two meg to work but I
haven't been able to get it to work under Pacifist.

If you downloaded a test version then you will need to get rid of that
and download ALL the zips. I originally said you would only need to
download the main zip file after but I've had to alter a few things on
the other disks....

Please let me know what you think.

 Yours Faithfully (In a very Silly way)

: it for MiNT/TOS can't be that hard... :) I wish I could try it myself...

Takes only a few minor ajustments if you use GCC and MiNT Libs.
I even compiled it with Sozobon once. The sound quality was awful though,
so it wasn't a very good port :-)

Okay folks, issues 20-37 of ICTARI are not on the regular ICTARI
page, and they're not yet on the FTP sites, but can now be found
at:

http://www.geocities.com/SiliconValley/Hills/3271/

There is also a link to this from the main ICTARI site:

http://www.elis.demon.co.uk/ictari/ictari.htm

For those that *still* don't know, ICTARI is/was the disk-zine devoted to programing Atari machines. If I ever get enough interest or contributions, then I shall try to do another one. In the meantime, there are now 52 disks worth of programming information out on the 'net. -Just put it to good use. One day there might be a complete HTML table of contents and index.

If you are going to distribute ICTARI via your PD library or user group, please give the snail contact address. If you want to link this site, please get the URL right. If you do there's a chance ICTARI could be a going concern again.

Enjoy Theeself,
"Augeas"

Like most C compiler suppliers, HiSoft only supplies
enough information with Lattice C to permit those who
already know how to use the library use the library.

Now if they had a companion tutorial, like the HiSoft
BASIC package, the system would be MUCH more user
friendly.

The only thing to watch out for is attempting to
write to the cartridge space -- that causes a bus
error. The cartridge port is read only.

If they supply a non standard library then they're going to have to
say which Lattice options are required to use it. If the library were
standard it would link would it not?

In any case there must be a 'librarian' - some utility equivilent to
such command line tools as 'ar' (which manages object libraries
amongst other things) or 'nm' which prints out the symbol table for a
given object file. This would detail the exact names used in the HC
library. ;-)

Maybe there's no write line or the mmu or summint prevents it. Dunno!

The docoder should be possible, the Fraunhofer IIS (the developer of the format) says the code is available for variuos processors, also for Motorola DSP56000 family, so the Falcon could do a good job. The encoder could be a problem, because even my P200MMX needs about 5-10 times the length of the input wave to encode it. An Atari is about 50-100 times slower, you know what that means...

>Couldn't that be a starting point? (instead of directly going all the

Diamond Edge has a function in the 'Partition' section which allows
you to 'Write partition Info Only'. I think this is principally there
to allow mending of damaged boot sectors but it should do the job you
want if you are careful with the arithmetic. It would probably be a
good idea to 'Zero' the two new partitions afterwards so that their
FATs are sanitary.

I'm currently looking for another copy of STOS (boxed with manual) and a copy of
the Game Maker's Manual.

I had both at one time but sold 'em when I sold the ST. I now find that I need 'em.

Alternatively, if there's anyone in the UK who'd be willing to lend 'em to me for a
couple of weeks then I'll refund the postage. I've started work on a STOS-like
language for the PC and need to see how STOS banks and modules are structured
so that I can build-in a bit of compatability.

Hi Popov,

> And I would like to know what is the adress of the parallel port on
> an atari st ?

Okay the parallel port is accessed by means of the sound chip. This is
located at the following addresses:

```
 $FF8800 Register Select/Read Data
 $FF8802 Write Data
```

The parallel port is connected to registers 14 and 15. The important part of
register 14 is bit 5, this is the strobe. Register 15 is where you put the actual 8 bit data.

To send data:

```
  Do
    Select register 15
    Write byte
    Select register 14
    Strobe
    Delay
  Repeat Until all characters are sent
```

Also bit 0 of the GPIP on the ST-MFP is used to indicate readiness to send. This is addressed to $fffa01. You should note that although the port is bi-directional there is no hardware method to indicate that a new byte is ready to be recieved. I can't remember where the switch to change direction is located.

John.

The first one is (only, but I could copy it if necessary) available via
the fVDI WWW page, which you can find a link to from my top page at:
  http://rand.thn.htu.se

>Could you give the complete path to each please.

I can't give you a more complete path than what I did, since that's all
there is to it. If you're using a Web browser to do ftp, you should try:
  ftp://rand.thn.htu.se/pub/Other/
Among other things you'll find the file mentioned (fvdi_85c.lzh) there.

Actually, fvdi_85d.lzh is the latest right now and fvdi_85e.lzh will
most likely be uploaded tomorrow.

If you still can't find it (which is very strange since several people
have already downloaded it), email me and I'll send it to you. It's
less than 30kbyte, so that shouldn't be a problem.

Version 0.85e is actually quite nice even in 16 colour mode on my machine.
All solid blits seem to work fine now (all blits are currently done as
solid) and solid fills work as they should. There's still no real text
acceleration (should be faster than the standard VDI, though) and all
text and other mono-expand blits, as well as patterned fills) are black
and white only.
On my AB040, this version (when the shadow buffer is turned on and the
cache operates in copyback mode) is between 50% and 200% of NVDI's speed.
The slowest numbers are for text drawing and the fastest for blitting.
Since the monochrome version is very close to NVDI on text drawing (and
actually up to five times faster for small text), I expect the 4 bit
driver to be as well once the real text acceleration is kicked in. :-)
(The shadow buffer is a copy of the screen which is kept in FastRAM.
 That way no reads need to be done from the real screen in slow ST-RAM.
 Without an '040, the shadow buffer is probably not a good idea.)

Martin-Eric Racine (q-funk@megacom.net) wrote:
: Is there any utility that allows splitting a partition in half?

Er, not as such, AFAIK...

: The idea is, you only loose data that is on the partition you split;
: you don't need to repartition the whole hard-disk and reinstall every
: application on every partition.

It shouldn't be _too_ hard to write... You'd just need some info on the structure of the partition table and rootsector (can be found in the linux-68k sources, in one of the header files).
You'd need to change the partition info in the table, the number of clusters, FAT size, etc. in the rootsector and -if you use a FAT filesystem- the FAT sectors themselves...

: I know the DOS market has such a utility, but I would need the same
: for my Atari. Either a GEM/TOS program or a MiNT port of some Unix
: utility is perfectly fine for me.

The problem is that nearly every system has its own parttion table format... (although the DOS and TOS ones are fairly similar, IIRC)

Is there an easy way to redirect the output to the console (STDOUT)
to a file under TOS when programming in C? I know how to do it under
MS Dos. Is there a way just as simple under TOS?

Easy stuff. The address lines are output lines even at the cartridge port. So a

```
   lea     $fa0000, a0
   tst.b   (a0, d0)
```

outputs the lower 16 bit of D0 to the cartridge port. The AS line, ORed with one of the two select lines at the cartridge port, can be used to tell some register at the port to latch the data appearing at the address lines.

Cheers Peter

Bugs in the GFA libraries. GFA is well known to cause bad code, i.e.
ignoring many of Ataris specs, therefore causing trouble all over the
place with modern systems.

Harun Scheutzow does very well. And he's written a system extension for it
called HSMODEM, with it you do not need to mess with the hardware.

Easy, just use the address lines as data-out lines. Of course this makes it
hard to read (or write...) to more than one address, think of it as a high
speed parallel-ish port...

It must be possible- there's a read/write parallel port adaptor which
runs in the cartridge port, and it certainly supports writing to ZIP
drives.

Newsgroups: comp.sys.atari.programmer

Hello all,

I'm implementing VA_START in one of my programs, and I've got some problems.
The command line passed via VA_START is displayed in the info line of the
window (it's a window form). I use Pure C.

Sometimes the line is perfectly readable, sometimes not (melt of low ascii
caracters or a string somewhere in memory but surely not a filename) so my
'load a file' routine fails.

To get this string, I do the following :

```
  int mesag[8]; /* the event buffer */
  long pointer;    /* a pointer for the string */
  ...
  pointer = ( (long) mesag[3]<<16 ) + mesag[4];
  wind_set (id, WF_INFO, pointer);
```

(I tried a char * pointer but apparently it didn't change anything except more
curious strings !!).

Sometimes I also get Magic hangs (system stack overflow, the system will stop)
when I drop files onto my prog desk icon (not talking about drag n'drop).
I don't have any idea of the cause. I free all the buffers I don't need but it
makes system stops.
Can somebody give me clues ?
Thanks a lot.

Hello all,

I'd like to know how to make a difference between ascii and binary files so my printing program won't load binary files.

Do you think scanning some bytes, say 64, at the beginning of the file should be reliable ? Can I say that, if i find an ascii caracter <32, it is a binary file ?

How did you partition your hard drive?

I believe if you have ICD Pro or an ICD host, it's a simple matter of using ICDFMT to go in and redefine your partitions. Use the setting to only write the info for the old partition and the new one you create, though, because you could repartition the whole drive by mistake.

Hi

Some characters will be less the 32 as these can be CR and FF
(carriage return & form feed) along with possibly other control
characters.

I do believe there is a program that can help determine what the file

is, I can't recall the title off-hand.
Cheers! for now
Steve

Hello,

I am wondering if I could use my ATARI 1040STE as gateway for my Atari 8-bit computer.

What I mean is that I want to connect to my internet provider with my STE and then run all other software from my Atari 8-bit with a terminal or something like that. The STE (only) has to keep the Slip/ppp connection going...

I want this because this way I can probably connect my 8-bit BBS to my e-mail box at my provider and automaticly import/export it to the internet.

Is there somebody who has made such a link in the past ???

Gtx,
Sysop*TXG -= The Underground Node #472 BBS =-

Running BBS Pro! V5.0b on ATARI 130XE with Black-box 140Mb scsi drive

and 28K8 Us robotics sportster...

It is read only, although there is a way to make it so you can read/write a 64Kb block. I can't remember where I got it, but I've a small (~8Kb) archive that contains the construction info for such an interface. The only problem with it, is it needs a PAL to work.

There isn't a write line and trying to write to it gets a bus error. Not

sure who generates it, probably the glue chip.

Rene de Bie (SysopTXG@underground.demon.nl) scribbled:
: I am wondering if I could use my ATARI 1040STE as gateway for my Atari
: 8-bit computer.
:
: What I mean is that I want to connect to my internet provider with my
: STE and then run all other software from my Atari 8-bit with a
: terminal or something like that. The STE (only) has to keep the
: Slip/ppp connection going...

If you install MintNet on your STE (may be a problem for memory), then you can dial-in (by modem or directly by null-modem) to your STE with a terminal program on your 8bit box. The STE will need pppd and mgetty or getty for that purpose. BTW, a potential problem is the fact that the STE has only 1 serial port, so how do you want to connect *both* modem and 8bit Atari ?

: I want this because this way I can probably connect my 8-bit BBS to my
: e-mail box at my provider and automaticly import/export it to the
: internet.

 Hmm, don't know if that will be easy. I have little experience with BBSs.

: Is there somebody who has made such a link in the past ???

 Well, I have set up a small Atari-only Intranet (TCP/IP based) a while
 ago. It had one Falcon as server, and two other Atari's as clients. It
 supported FTP, HTTP, etc. If you have any questions on that, just reply
 to this post.

 Greetz,

Could anyone help me with the following?

I'm attempting to write a D2D playback routine which doesn't seem to work.

I've included part of the code (asm) below.
The first part of the buffer plays and the interrupt does occur, but the second half of the buffer doesn't play.

As a test I changed the timer I was using to Timer B, which did play all the sample, but had the expected result of playing it all extremely fast and also crashing the machine. Well I think it played it all, no real way of telling other than the disk activity.

The program is executing an evnt_multi() loop check a flag (called d2dNext) which is set by the interrupt routine. When this is 1 the code for playing and loading the next parts of the sample is executed.

David

Hi

Someone told me that I need do chenge act_pd to make save Memory
allocation in an Accessory. This seems to be a System Variable
That holds the Process Descriptor of the current Programm.

Where do I find this variable?

Christof

  There isn't one-way : here's some hints.
- If the file begins with $601A, it's a gemdos executable.
- If there is zeros (bytes), should not be a text (same for weird <32 chars :
1-8, 11, 14-26, 28-31)
- If there is many cr/lf chars (13,10), it's _probably_ a text. (same for
spaces=32)
You can define yourself some heuristics ...

(oui, c'est encore moi ;-)

Hi!

In article <6le85j$i9e$1@news4.isdnet.net>,
     frederic.dinh@hol.fr (Frederic Dinh) writes:

```
>   int mesag[8]; /* the event buffer */
>   long pointer;  /* a pointer for the string */
>   ...
>   pointer = ( (long) mesag[3]<<16 ) + mesag[4];
>   wind_set (id, WF_INFO, pointer);
```

Make sure you calculate with unsigned values here, or limit them to 16 bits. 'int' is signed, so if mesag[4] happens to be >= 0x8000, it's a negative value and you won't get the correct result. Better use something like this:

```
pointer = ((long)mesag[3] << 16L) + ((long)mesag[4]) & 0xffffL);
```

Ciao

Thomas

But /only/ with single tasking AESes, so check whether global[1] is == 1 before doing so!

> This seems to be a System Variable
> That holds the Process Descriptor of the current Programm.
>
> Where do I find this variable?

You find a pointer to act_pd in the TOS header. If you need more
information, I can look it up for you.

Ciao

Thomas

>
>(I tried a char * pointer but apparently it didn't change anything except more
>curious strings !!).

Tu ferais de toute façon nettement mieux d'utiliser un char * : c'est bien
plus propre.

La façon la plus simple d'éviter des problèmes douteux avec des trucs
aussi peu propres (convertir 2 ints en en char *, c'est la porte ouverte aux
ennuis...), le mieux est de profiter des unions :

```
typedef union
{
  int type; /* Le type du message : toujours le premier int des 8 */
  int general[8]; /* Message générique : 8 int */
  struct
  {
     int entier_1, entier_2, entier_3; /* Oublié le sens, mais bon :-) */
```

```
     char *chaine;
     /* Et la suite */
  } message_va;
} Message;

Message truc;

evnt_multi(MU_MESG, ..., &(truc.general), ...);

switch (truc.type)
{
case ...
...

case VA_START:

     chaine = truc.message_va.chaine;
     printf("Chaine transmise : %s\n", chaine);
     ...
}
```

C'est plus lourd, mais au moins on est s□r que □a marche...

Plus l□ger, mais moins propre (mais alors, franchement moins...) :

```
char *chaine;
int message[8];

chaine =  *( (char **) (message + 3) );
```

I think it's called 'WHATIS', or similar. It's hidden somewhere on one of the ST Format or ST User coverdiscs. Not sure which one it is... Right, version 6.7 is on the ST Format coverdisc 74, and is 16.5Kb long. It's presently an accessory, although it works as a application as well. It works under Magic, but it's not too good at recognising some types of files. It thinks that GFA basic and resource files are Tiny format pictures.

Hi Terence!

>Is there an easy way to redirect the output to the console (STDOUT)
>to a file under TOS when programming in C?

Just use GEMDOS Fforce(1, handle) to redirect stdout to a file you opened
using Fopen. For example, the following redirects stdout to "output.txt".

```
{
     long handle;

     handle = Fopen("output.txt",1);
     Fforce(1,(word)handle);
     puts("This goes to output.txt");
     Fforce(1,1);
     Fclose((word)handle);
}
```

Hope that helps,
     Lars

Greetings,

I am an "old" Atari owner how has just recently returned to this
wounderful platform. For a while now I have been programming C++ on the
PC, but now I would like to use it on my Atari. Is there a C++ compiler
for the Atari? I have heard of Gnu C++ being ported to Atari, but I
don't know what files I need for it. Help? Is it possible to program GEM
under gcc? Please help me start to program for the Atari again!

Shine on you crazy diamond(s)

/Tobias

Bonsoir,

Quelques explications (en français parce que c'est du C pas de l'atari alors :-), qui j'espère seront plus simples.

Dans l'article <6lhir6fho3@news4.isdnet.net>,
Frederic Dinh, <frederic.dinh@hol.fr> a écrit :

>> La façon la plus simple d'éviter des problèmes douteux avec des trucs
>> aussi peu propres (convertir 2 ints en en char *, c'est la porte ouverte aux
>> ennuis...), le mieux est de profiter des unions :
>
>Déjà, ca s'annonce chaud... j'ai jamais utilisé les unions...

En deux mots:
- une union est une façon propre de déclarer quelque chose dont le type est variable. Exemple type sous GEM : le champ ob_spec des objets. Classiquement, on dit que c'est un long et on fait ensuite des bidouilles. En fait, l'idéal serait de dire que c'est _à la fois_ un long, un char *, un TEDINFO *, un... Chance, ça se fait en C avec le union. Ce serait donc:

```
union
{
  long divers;
  TEDINFO *tedinfo;
  ICONBLK *icone;
  char *texte;
  ...
} ob_spec;
```

Dans ce cas, si tu utilises ob_spec.divers, il sait que c'est un long; si tu utilises ob_spec.texte, il sait que c'est un pointeur sur une chaîne; ainsi de suite.

La syntaxe d'utilisation est exactement celle d'une structure apr►s►:

ob_spec.divers indique l'►l►ment divers de l'union.

Ce qu'il faut savoir (c'est ce qui le rend tr►s pratique)►:
- la taille r►ellement occup►e est celle de l'objet le plus gros de l'union►;
- les donn►es sont mises dedans ► en vrac►► et donc leur nature ne d►pend que de l'objet que tu appelles. Exemple : si tu fais

```
ob_spec.tedinfo = NULL;
printf("%f\n", ob_spec.divers + 2);
printf("%p\n", ob_spec.tedinfo + 2);
```

Tu auras en sortie►:

```
2 ( = 2L + 0L)
2*sizeof(TEDINFO) (= NULL + (TEDINFO *) 2) = 56 si ma m►moire est bonne
       et en m►moire, ► l'adresse &(ob_spec)►: 0x00000000
```

Est-ce que le r►le de l'union est plus clair maintenant ?
(Le gros avantage : contrairement au cast brutal (char *) depuis un long, ►a ne suppose pas que sizeof(char *) = sizeof(long), ce qui marche sur l'atari mais est d'une portabilit► douteuse... [tu me diras, avec le GEM... Je dirais►: m►fiance si tu veux utiliser, par exemple, la lib X/GEM que je d►veloppe :-)]

```
><gonna be hot... never used unions before...>
>
>> typedef union
>> {
>>   int type; /* Le type du message : toujours le premier int des 8 */
>>   int general[8]; /* Message g►n►rique : 8 int */
>>   struct
>>   {
>>      int entier_1, entier_2, entier_3; /* Oubli► le sens, mais bon :-) */
>>      char *chaine;
>>      /* Et la suite */
>>   } message_va;
>> } Message;
>
>Arrgh ! Trop fort !
```

Donc l►, le type Message est _► la fois_

```
1) un entier               : champ type
2) un tableau de 8 entiers : champ general
3) une structure contenant 3 entiers puis un pointeur de cha►ne (il faudrait
les 3 entiers manquant pour bien faire...)
```

Si en m►moire tu as un truc du genre

```
0x0001    = Message.type  = Message.general[0] = Message.message_va.entier_1
0x0002                    =                 1  = Message.message_va.entier_2
0x0003                    =                 2  =                           3
0x0004                    =                 3  } = Message.message_va.chaine
0x0005                    =                 4  }
0x0006                    =                 5
```

```
 0x0007                    =                 6
 0x0008                    =                 7
```

>C'est b€ ! M€me si j'ai du mal € suivre ! Les entiers entier_x servent €
>"aligner" chaine sur le 4€me mot du tableau (mon mesag[3], quoi), c'est €a ?

    Oui. En fait, entier_1 = message[0],...

>> C'est plus lourd, mais au moins on est s€r que €a marche...
>> Plus l€ger, mais moins propre (mais alors, franchement moins...) :
>> char *chaine;
>> int message[8];
>> chaine = *((char **) (message + 3));
>
>Te moques pas, j'ai d€croch€ - et dire que c'est plus l€g€ ! Je vais passer un
>peu de temps € piger l'indirection (c'est bien €a non ?) et je reviendrai...

    message[] est un tableau d'int donc message + 3 = &(message[3])€; on
fait croire au compilo que l'adresse de message[3] est en fait un pointeur sur
une cha€ne (char *), et on prend la valeur de ce pointeur de cha€ne (*(...)).

The usenet feed to my ISP has had NOTHING NEW
on ANY of the Atari newsgroups for three days.
I'm posting this test message to a little-used
Atari group to determine whether I still have
access to Atari ng's!

There is no need to respond.

>Can somebody give me clues ?

Imagine mesag[4] is $8765 and mesag[3] is $4321. The result you are after is $43218765 but this is what really happens:

mesag[3] is promoted from signed int to signed long, so $4321 becomes $00004321. It is then shifted left 16 bits to become $43210000. Okay so far (but technically incorrect).

As the compiler has promoted one argument to signed long it is obliged to do so with the other arguments. In this case mesag[4] is promoted from signed int to signed long so $8765 becomes $FFFF8765. Finally, this is added to $43210000 giving a result of $43208765.

The answer is to use unsigned math when manipulating pointers. It is also more usual to use bitmasking rather than addition. There are two ways of doing this. You can declare some intermediate variables or use the required casts.

```
/* this is a bit extreme but is legible */
int  mesag[8];
uint lo_word,hi_word;
ulong    lo,hi;
char *pointer;

hi_word = mesag[3];
lo_word = mesag[4];
lo = lo_word;
hi = hi_word;
pointer = (char*)(hi | lo);
```

whereas casting would require this

```
int  mesag[8];
char *pointer;

pointer = (char*)(
(((ulong)(uint)mesag[3]) << 16) |
((ulong)(uint)mesag[4])
);
```

which can be simplified of course.

On another matter. There is an undocumented limit on how long the string can be for a window name (WF_NAME) under MagiC. This may apply to the WF_INFO line also. Thus it is wise to manually truncate the

line with a nul should it exceed (roughly) 200 chars.

Unfortunately no. There isn't a method which is 100% reliable. Any
given file could contain any value in the range 0->255 and still be a
valid text file, or vice-versa.

Another name for this variable is p_run and although you can mess with
it you shouldn't because it is documented read-only.

>Where do I find this variable?

You might not need it. It is true that an acc using Malloc causes the
memory obtained to be owned by the main application, thus when the
main application terminates the memory is lost. However, memory
allocated before the first AES call made by the acc *is* owned by the
acc. Therefore, if you are able to determine your memory requirements
before appl_init() in effect, you don't need to fiddle with p_run.

Additionally, such operating systems as MagiC don't suffer from this
problem - and the accessory is best executed as a normal process in
any case. You should be safe interrogating the entry in the global[]
array which specifies the maximum number of concurrent processes. If
it is not 1 then you are multitasking and can start a normal process.
If it is 1 then you should start as an accessory.

Indeed. :-)
Try "Professional GEM" (ProGEM) by Tim Oren, it's a good text to start with.
It should be on most big Atari FTP sites...

Even though there might be people who want to read it, but do not speak
French fluently. Furthermore, posting slightly off-topic is no reason not
to use the preferred langauge for a newsgroup, is it? You could have used
private mail, instead.

No offense, though, just a hint.

Ciao

Thomas

> lo = lo_word;
> hi = hi_word;
> pointer = (char*)(hi | lo);
```

Well, this won't ever work, either. pointer will still contain a
16-bit-value aftwards. For example, let mesag[3/4] be 0xaaaa and 0x5555:
pointer will be 0xffff afterwards, which sure isn't what you want.

I can't think of a (simple) way to do it without shifting in plain C.

Ciao

Thomas

I can't recall what my problem was but I do remember having one with
objc_change() so now I always use objc_draw(). In fact, as all my
forms are windowed and can be active in the background I actually
perform a proper redraw.

Now that I think about it, the problem I had might have been that
objc_change could select something but not _always_ unselect it. Can't
be sure after all this time though.

Erm... Look again:

short Xdial_ParseKeybd (XDIAL *dial, short key, short ctrl)

This function is called from an event loop, with key and ctrl containing the values for the key pressed and the control keys. After some checking, the key value is passed to objc_edit:

objc_edit (dial->tree, dial->obj_edit, key, &dial->edit_pos, EDCHAR);

: that you're not in an evnt_multi() loop. You do realize, I hope, you
: have to be in an evnt_multi() loop and call objc_edit() for each
: keyboard event?

Hence the function name ParseKeybd ...

>Are the lines double spaced? Might be a "single pixel" problem. If

No, there's far more space than that between them. I'd say at least ten
lines worth. At least for CAB, I also think that some text is actually
missing completely.

>Gut feeling on my part is some sort of character cell issue but there
>are 101 ways that could arise.

On the tests I've done, fVDI and NVDI have reported the same size for characters and strings. I guess it still _must_ be something like that, though.

>Likely. The interaction between vqt_extent and vqt_font_info can be
>quite complex for instance, especially when using "special effects".

fVDI currently doesn't support any text effects.

>>If anyone has any ideas about what might be going wrong (or have some
>>similar program (doing 'advanced' text output)
>
>Can you be more specific about what 'advanced' text output consists

Well, that would be whatever it is that CAB and AtariWorks does which isn't done by ordinary text editors. ;-)
From what I've seen of Papyrus (old version), that program doesn't seem to have any problems either, but I suspect it only uses the VDI to blit things it draws in internal buffers.

Perhaps the programs set/check font sizes in some strange way. They certainly use varying alignments and justification.
I don't see why any of that should be a problem, but something must be.

>If you can describe the attributes of the problem line(s) well enough
>then perhaps I could cobble together a small program to send to you -

All lines exhibit this problem. It doesn't matter if they are drawn in proportional fonts or not and neither does size matter.

If you have CAB (I found the problem with a demo version) or AtariWorks it's easy enough to test it yourself. Just download the normal fVDI v0.84 archive (for information on how to set it up) and the new fvdi_85c.lzh (only via ftp from my site in /pub/Other) and
- create an fvdi.sys file (normally on c:)
- put 1_plane.sys (the monochrome driver) in the same directory as your fonts
  (usually mentioned via the PATH variable in fvdi.sys)
- switch to a monochrome graphics mode
- run fvdi.prg
  (note that current fvdi versions _can't_ run in the autofolder)

Everything should now look just about as it used to, but fVDI will be running instead of the previous VDI.
Things to check for to make sure its really fVDI:
- A small font is used for the menu and a few other things (for a while)
- XOR mode only works for lines that are vertical or horizontal
- There are no line patterns
- No text effects are available

If you were running the standard VDI before, things should also be a lot quicker.

>hopefully it will "screw" up as well. The bug should then be pretty
>easily located as you'll be able to use a debugger on fVDI whilst
>following my source code.

I don't even need source code as long as the cause and the effect are
reasonably close. Unfortunately, that doesn't seem to be the case with
the programs I mentioned.

: protection si lame, and it doesn't protect a lot ! If you have a NULL
: pointer problem, try to look at YOUR program first.

Well, it's all solved now. Still, I don't think a NULL pointer (if that was
really the problem) should crash my Mint for several reasons :

* Mint does not seem to use logical address spaces (for compatibility I
  guess), so a NULL pointer is almost always out-of-bounds, thus should
  generate a Bus error, segment violation or whatever.
* Address 0 lies within the 2048 'supervisor bytes' and therefore should
  generate a Bus error, whether under Mint or SingleTOS or any 680x0 system.

Greetings,

Greetings Atarians!

I made some adjustments to an example program for window-handling
(which I found at some ICTARI issue) so that it can show the
content that I want in GEM-windows.

My problem is that it throughs a zillion of bombs at me when I try to
run the compiled program, although it runs OK when run from the editor.

I guess that it can be caused by a lot of things, but if someone has
even the faintest idea what do look out for, please let me know!

thanks in advance! /Joakim

I can program in assembler on a pc, so I think I could do this on an atari.
So what should I do ?

And I would like to know what is the adress of the parallel port on an
atari st ?

Can anyone help. I have tried recording samples from tape but keep
getting too much background noise. I want to record my samples on the
PC and convert them so they work on the STFM. I can get them to work
on the STE but they don't sound right on the FM. Any sample converters
that will convert PC recorded samples to work on the FM?

Hmm, considering Leviens

> Indeed. So it should do just fine...

apparently this is what he asked for. To me however it clearly looked as if
he wanted the (due to the ALT key) *modified* ASCII code of the key. The
concept of "*the* ASCII code for a key" is not defined, since already pressing
the shift key makes "the" ASCII code become entirely different. Both values
can be obtained by looking up the tables returned by Keytbl(). However pressing
ALT makes the code become different again for many keys, and this new value
cannot be obtained from these BIOS tables. This is all what I pointed out,
since for me it was clear that it was that what Levien asked for.

Cheers Peter

MI>I am looking for information on Atari C compilers. Please post to
MI>this group. Thanks
What exactly were you hoping for? I use Heat'n'Serve C because it works

well, and it's freeware. Also because it's based on the Alcyon C from the
Atari devkit it is nicely compatible with all the code examples I find
in the old programming books.
I also use the object linker for linking my DEVPAC v2 assembly code while
I'm studying a book called "Compute!'s Atari ST Machine Language Programmin
Guide". The code examples make external calls to the Alcyon object
libraries, and DEVPAC v2 lacks a DRI object file format compatible linker
and libraries.
Later...

Hello,

I realised that using the parallel port wasn't easy. So I think that I could use the pins RTS, CTS, DSR, DTR, RI and DCD on the serial port.
I still want to program with the gfa basic, but I noticed that I can include ASM routines with the function call.
So I'd like to know how to :
1) set and reset the pins RTS and DTR
2) get the condition of the pins CTS, DSR, RI and DCD

Now, I think (I hope ;-) that it's going to work correctly.

Thanks in advance for your answers !

You're absolutely right! Sorry about that. I never saw that code, because I thought I had reached the end of the message. :)

>This function is called from an event loop, with key and ctrl containing the

Try

```
  int new_objc;
  if (form_keybd(dial->tree,dial->obj_edit,dial->obj_edit,key,&new_objc,&key);
    objc_edit (dial->tree, dial->obj_edit, key, &dial->edit_pos, EDCHAR);
```

instead.

Thanks everybody who have bothered to answer my questions so far.. 8)
I have now noticed that the compiled program runs fine
if I don⍰t limit the memory with $MXXXXX.

Any ideas why it won⍰t run it can⍰t have access to all memory?

Thanks in advance!

It is the value in `key' and `key_shift' that is modified by ALT and
SHIFT etc. after a keyboard event, but I have never heard this called
the `ASCII code'. What remains constant - or should remain constant -
is key>>8. You can use that value to look up the real ASCII code in
different tables pointed to by Keytbl(), depending on the value of
key_shift. Maybe the terminology wasn't one hundred percent right, but
the idea was, to me at least, clear.

Hi Atari friends!

For those of you who don't know me, I'm aka NoBrain of NoCrew. I was one of the two making the mp2 player for Falcon.

I also started a project of making an mp3 player, by converting from C sources of the amp player. This is however dropped now, for some reasons.

I've heard of a few people also working on, or thinking of making, an mp3 player for Falcon. I therefore have the suggestion of instead of some people trying at their side, we'd try to unite the effort, or at least share what we have done so far, or ideas that we have.

NoCrew has a mailing list running, nocrew-mp3@nocrew.org. This was mainly put up when I was working on the player, and has been very dead for a long time. But, it would be a good place to discuss the development of a player. You subscribe by sending a mail to nocrew-mp3-request@nocrew.org with the subject "subscribe".

Although I can't forbid anyone to join the list (well, I could :), this is what I would like it to be:

Talk about development of a possible mp3 player for Falcon.
_NO_ questions like, where can I get mp3 files, this and that song.
_NO_ mails simply asking how things are going.

I know a lot of people wants to have a player, but few are willing to try to write one. A few things that everyone might not know. An mp3 player on Falcon _will_ use the DSP, so you'd have to be able to program the DSP to make one, obviously.

Alright, this was my idea. Now, all it takes are people who want to join. :) If you know the DSP and don't have anything better to do, what are you waiting for? :)

Comments?

Sorry I didn't make clear what I really wanted. Making other apps
terminate wasn't the problem. I only want to know where on the hard disk
they can be found, so that during shutdown I can save all their names.
When booting up again I can start all apps from disk via shell_write().
The result: My system boots in just the mode I quit it.
I think 'Multistrip' does sth. alike, so it should be possible.

> that will convert PC recorded samples to work on the FM?

The STe play signed samples, most ST sample players are using
unsigned samples. (ie STe: MIN = 128, ZERO = 0, MAX = 127, and
ST: MIN= 0, ZERO = 128, MAX = 255)

To convert the sample to ST format XOR every byte value
with 128 (=0x80).

Hope this helps,

Hans

> I think it's feasible with peek and poke.

It is not that hard to do it with some peek and pokes,
but it is easy to blow up your printer port, and with it the
soundchip on an Atari.

The parallel port on an Atari is controlled by the soundchip
(all data lines plus strobe) and the MFP (busy). More
lines are not available on an Atari.

Bits are counted form 0-7, with 0 lsb and 7 msb

How to control them:
You have to program the soundchip. The soundchip
has two registers:

Adress	Acces	Name	Function
$ff8800	R	giread	Read the selected register
	W	giselect	Select a chip register
$ff8802	W	giwrite	Write the selected register

Relevant registers:
7: Mix control + IO port select
   Bit 0: 1 = Sound A off
   Bit 1: 1 = Sound B off
   Bit 2: 1 = Sound C off
   Bit 3: 1 = Noise A off
   Bit 4: 1 = Noise B off
   Bit 5: 1 = Noise C off
   Bit 7: 0 = Port A on IN
           1 = Port A on OUT
   Bit 8: 0 = Port B on IN
           1 = Port B on OUT

14: I/O Port A (used as output)
   Bit 0: disk side 1=side 0
   Bit 1: drive select A 0=select
   Bit 2: drive select B 0=select
   Bit 3: RS 232 RTS
   Bit 4: RS 232 DTR
   Bit 5: Strobe parallel port
   Bit 6: P3 monitor bus
   Bit 7: Not used on ST's

15: I/O Port B data lines

So to set data on the printer port, you have to switch
it to output (normal configuration):

```
reg is of type byte

poke $ff8800,7       'IO select
reg= peek($ff8800)   'read register
reg = reg OR 128     'set port on out
poke $ff8800,7       'IO select
poke $ff8802,reg     'write register

' I/O B is now on output

poke $ff8800,15      'I/O port B
poke $ff8802,192     'bit 7 and 6 are now high
```

Note that you have to disable the interrupts when writing
to the soundchip. System interrupts are also accessing
the soundchip.

You can get clean acces whit the OS function Giaccess (XBIOS 28)
char Giaccess(char data, WORD regno)

Return is the value of the selected register
regno: select register 0..15, add 128 for writing to the register
(-> 128..143).
data: data to write in case of write select.

The busy line can be read from the MFP:
$fffa01 R GPIP data register
  bit 0: BUSY from parallel port
  bit 1: RS 232 DCD
  bit 2: RS 232 CTS
  bit 3: GPU done
  bit 4: IRQ keyboard or MIDI ACIA
  bit 5: INT from FDC/ACSI bus
  bit 6: RS 232 RI
  bit 7: Mono monitor detect

This is in a nutshell the parallel port of tha Atari ST.

Hans

Well, with the registers of the parallel port I gave you also
all available registers off the serial port.

Why don't you make it more general. I have a TT and would like to use
a player to. Is it not possible to make the software use the DSP when
it is there and otherwise the normal processor, just like sometimes
done with the floating point processor?

Cecil Westerhoff.

The Hisoft C Toolbox is a 'library' of windows management routines which
simplify the use of the GEM and VDI libraries, and are available without
explicit declaration. "The Hisoft C Toolbox is supplied already compiled
as a library for use with Lattice C, and can simply be linked
in." (Lattice C User Manual). The compiler finds the headers ok, but
linker reports that library routines which are in Toolbox cannot be
found. The toolbox library file is in the library folder, and I have
edited the default linker command line to tell it to include the file in
the library file list.

The problem is that even a "fast" CPU as 32MHz 030 is too slow for mp3
decoding. The FPU surely helps a lot, but still not enough to be able
to do it in realtime. There are some ways to make the decoder much
fast, if the quality of the sound is reduce significally.

Although optimization for CPU/FPU and DSP assembler are quite
different, you're probably right in that development of both can take
advantage from each other. You're free to try ;)

The Amiga has several mp3-players, a few of them even works in
real-time on 14MHz 020. Sure, the sound-quality isn't the best, but
I'm sure that one of these players can be converted to a 030-Atari.
Not that I want to do it... ;-)

I would not mind to try, but I do not know anything about mp3 on the
technical level. Also I almost only program in C. I have done a little

bit assembler, but that has been in the far past. And the floating point processor I have never used. (Maybe some programs, but I understand most programs do not use it.) But if you think it would be possible for me to contribute to the Atari community. I would be glad to keep the Atari a little more interesting to the userbase.

This sounds like something we need. Surely if a 14mhz '020 Amiga A1200 can do it, then my 14 meg, 25mhz '030 (Nemesis), 50mhz DSP, 50mhz FPU, equipped Falcon can! Let alone a Falcon like Jo Even Skarsteins (Beer! Maria! Falcon! Babylon 5!) AfterBurner model! ;-)

IMHO I would for starters also be very glad to have a (slow) mp3 encoder/decoder for atari (falcon) so at least it is possible to exchange files with various resources :)
decode them offline and play them as wav of aif or avr or whatever.

Couldn't that be a starting point? (instead of directly going all the DSP way)

The Fraunhofer decoder routines I compiled on Falcon have not ever

worked yet...
lots of sync problems.

And why don't you begin with a _real time_ MP2 player for falcon (or TT), and
then a MP3->MP2 translator, not real time (because of lack of speed). The only
MP2 players I saw for falcon are only C ports of PC sources : takes 10 minutes to

decode 1 minute of music !
That would interest me.

Eric

There is a realtime MP2 player for the Falcon! Uses DSP! Made by NoCrew or
whatever they're called!
A MP3-MP2 translator would really be great!

Cheers!

/Peter

Hi

> And why don't you begin with a _real time_ MP2 player for falcon (or TT), and

Well, it already exists for the Falcon [see NoBrain's original post].

> then a MP3->MP2 translator, not real time (because of lack of speed). The only

That will be extremely slow... MP3 encoding is very slow, and I'm pretty sure
that MP2 encoding is of a similar speed... whether you can take a short-cut
because its already in MP3, I dont know...

> MP2 players I saw for falcon are only C ports of PC sources : takes 10 minutes

No, not really. I don't know much about encoding, more than that it's
a very complex algorhitm andtakes quite a lot memory and time. The
very last part of the decoding is the same for MP2 as for MP3, but all
before is different in several ways. So, a translator would pretty
much be an MP3 decoding followed by an MP2 encoding. IMHO, it wouldn't
be worth the effort.

Yeah, its unlikely that a stock TT could decode a full 128kbs mp3, but I'd
still like to hear from someone who's actually* tried* how it manages on
low bitrates, ones suitable for streaming audio. (wink wink :) Say, 8kbps
which is the lowest l3enc will go...

In theory, mpg123 should compile no problem on a Linux-68k system. Hacking
it for MiNT/TOS can't be that hard... :) I wish I could try it myself...

Yeah, forget realtime for now. I see no reason why a plain ST couldn't
decode an MP3 given the proper software and enough time... ;)

Ack, gotta get my MegaST4 back from my dad... Otherwise I have to make do
with a 1mb 520STfm, I doubt SozobonX is gonna like the mpg123 source... :)

>Couldn't that be a starting point? (instead of directly going all the
>DSP way)

I would think one of the existing Unix players (mpg123!) would be trivial
to get running under Linux-68k, (I say again :) as a starting point. Then
you could move on to a MiNT port, and then plain TOS... Now where did I put
that GCC...

I have compiled the amp player without problem in Linux/m68k, it was
what I used when I first tried to convert it into DSP code. There
should be no problem at all to make a MiNT version as well. The
mpegaudio package, with encoder and decoder, is already ported to
MiNT. AFAIK, that package also includes Layer 3.

The amp player when decoding an mp3 on my 16MHz 030 + FPU in Linux,
was about 40 times as slow as realtime.

The reason why I requested for a realtime player, is that it's slow to
convert (mp3 decoding plus mp2 encoding) and it takes up much
space. There are already ways to convert it now, for people who would
have spent a little time to compile some of the programs that are
available.

Personally, I use Linux far more than MiNT and TOS on my Falcon, and I
don't have gcc more than for Linux.

If you don't know where to find sources for Unix players, look at
http://www.mpeg3.com

About the Amiga players, I've mailed the author of one of them, and am
waiting for answer.

Maybe editing the default linker command line is not the way to go.
List the toolbox.lib file (or whatever it's called) in your project
file. This is the only way I have ever gotten my own libraries to be
linked in Lattice.

Is there any utility that allows splitting a partition in half?

The idea is, you only loose data that is on the partition you split;
you don't need to repartition the whole hard-disk and reinstall every
application on every partition.

I know the DOS market has such a utility, but I would need the same
for my Atari. Either a GEM/TOS program or a MiNT port of some Unix
utility is perfectly fine for me.

Please Cc your reply to my e-mail, if you have a positive answer.
Thanks.

Silly me. When you said "parallel port" I was thinking "cartridge
port"!!!

I've not programmed the printer port myself but according to the

Compendium it uses port B of the Programmable Sound Generator (PSG) which is a Yamaha (YM-2149) chip which is accessed via two locations at $FF8800 and $FF8802. The Strobe line is bit5 of port A on the PSG.

The BUSY signal is attached to the Multi Function Processor (MFP) chip which is an MK68901. It's bit0 of the Active Edge Register (AER).

The are two XBIOS calls which set and clear bits in port A of the PSG, Ongibit() and Offgibit(). The xbios call Mfpint() defines an interrupt handler for the MFP. The xbios functions Jenabint() and Jdisint() enable and disable the interrupt. I've never used any of these OS calls either.

If you mess with the ports directly or need to change the processor interrupt level then you'll need to have it running in supervisor mode. There is a call for this also, called Super().

Hopefully someone else will see this and correct any mistakes I may have made, or even better, post some example code which reads and writes the port!

All that lot is in the 68901. It starts at [um I've forgotten, $FFFA01
iirc].

> Now, I think (I hope ;-) that it's going to work correctly.
>
> Thanks in advance for your answers !

How about the cartridge port? That just starts at $FA0000 and ends at
$FBFFFF inclusive. Does anybody know of a reason why that wouldn't
work? The only thing I can think of offhand is to avoid accidentally
making the ST think there's a real diagnostic or application cartridge
in there?

If the library is supplied with Lattice it would make sense for Hisoft
to have included an example?

If there's an example then I'd be surprised if it didn't include a
project file. This would be much more preferable than editing the
default project file. From what I've heard Lattice has a myriad of

options. For instance, it is convention for C functions to have a leading underscrore prepended to their names within the object libraries. There are sometimes options for discarding this automatic conversion and for implementing all sorts of other possibilities, all dependant upon the compiler. Support for foreign languages is not unusual. An option for linking object code written in Pascal would typically require the compiler to convert all your function names to uppercase and plonk the @ symbol in front of each.

I'm certain this is just a linker configuration problem. Locating an HC project file would solve this.

I get the idea.

You might get away with using shel_read and modifying the global array
to fool the Aes into thinking it is the original app which made the
call. shel_read is a bit idiosyncratic though!

The other possibility is to perform a simple Dgetdrv()+Dgetpath()
whilst whilst using the process id of each of the apps. As you're
shutting down you might get away with hacking p_run.

>I think 'Multistrip' does sth. alike, so it should be possible.

Dunno what Multistrip is. :-)

This is related to the memory leak problem below. In a standard ST
display: draw off the right edge and it'll just corrupt the left edge.
This is easy to see. Draw off the top or bottom and things will
usually go pear-shaped.

>My problem is that it throughs a zillion of bombs at me when I try to
>run the compiled program, although it runs OK when run from the editor.

Zillians of bombs result typically result from multiple processor
exceptions, the cause of which will be corruption of your compiled
code, causing the processor to jump somewhere stupid.

>I guess that it can be caused by a lot of things, but if someone has
>even the faintest idea what do look out for, please let me know!

Sometimes memory leaks go undetected when editing because they just so
happen to be corrupting part of the editor/compilation-environment
which doesn't happen to be critical at the time. It happens more often
than you would think.

Hello Mike!

I don't now about such a program,
but I can write such a program in Omikron.Basic for you if you want so.
It is also possible to compile it.

E-Mail me, when you are interested in it.

Armin

I have a C-Lab Falcon MKII which I purchased from Toad Computers 2-3 years ago. Since December of last year I had been having trouble booting the Falcon with the cdrom drive and scsi cable connected to the Falcon's scsi port. Every time I tried booting the Falcon in this way, the boot partition would become corrupted and I would have to reload the boot files. The other day, I tried it one more time and the worst happened...the Falcon no longer operates. The fan comes on, the hard drive starts to spin up, and nothing else happens. I disconnected the hard drive and tried to boot from floppy---nothing. The fan comes on and the power indicater light comes on but that's it. No floppy activity. Does this mean that my $1400.00 computer is now junk? I am now very frustated, sad, and angry. What can I do now to rectify this situation that won't cost me an arm and a leg to fix? All I really want to do is to get the machine up and running again in order to be able to use it as trade in for a TOS clone motherboard/cpu.
Thank you,
Sam Ferrer

NeoDesk combined with the NeoDesk CLI can launch any TOS or GEM-based program reliably, with any version of TOS. It's all in the way the CLI tells NeoDesk to run the program, rather than running it itself.

I don't know a lot about MiNT but I am trying to install the system on this TT. I am using the 1.14.6 version in the MINT030.PRG configuration.

The first thing I notice is that it will not recognise drives beyond

P:

Is this a restriction on ALL MiNT versions or is there some .CNF
parameter which I can use to extend the drive map?

Hello all,

I wonder why objc_change(... DISABLED,1) or any other ob_state works, but not
with SELECTED.

If I want my button to be redrawn immediately, I have to use objc_draw(). This
occurs under TOS 4.01 and Magic 5.13.
Thanks for all answer.

>and that it was just emulated in the software.

Sort of true. Sprites "just are" - how they are implemented is nothing
to do with sprites themselves. On the ST sprites are implemented via
the LineA interface. The LineA refers to a set of unused instructions
in the processor, all of which start with an opcode of $Axxx, hence
the name (there is also a LineF on the 68000 as well). LineA and LineF
cause a processor exception, the handler for which dispatches the
processor to the required routine.

>(perhaps to take advantage of a later hardware upgrade?)

LineA calls will take advantage of the blitter chip if one is fitted.
Perversely, recent software add-ons are so efficient that greater
speed can be obtained by turning the blitter *off*!!

Others will be able to advise if there are suitable libraries which
provide this.

Failing that you have two choices. "Bodge" it or do it yourself.

Bodging
=======
This works very well for simple output. You just create an object tree
with G_STRING or G_TEXT objects in it and write the lines to them, and
a scroll can be implemented quite easily. Being a tree in a window the
rest of the code is not much different from any other windowed tree.

Do it Yourself
==============
This can be as simple or as complex as you like. For a monospaced font
it isn't too hard. Maintain a "console buffer" somewhere in memory and
write to that. Update the screen from the console buffer when
required. The more features you add to the console the more work is
involved (bold, underlined, colours etc) as these must be remembered
in the console buffer as well.

Proportional fonts are trickier because not only do you come up
against the problems of implementing it, you are forced to figure out
how to do so in such a way that output doesn't slow to a crawl. Use
baseline alignment.

The single most important thing you can do to increase speed is

perform "line/string" output rather than character output. This is
especially true with proportional fonts. Prefill the background then
use v_gtext in transparent mode, it's faster. Save the results of
vqt_extent in an "extent" buffer because it takes nearly as long as
v_gtext does.

I don't use MiNT but even so, I'm not too sure what it is you are
wanting to do? Is it some sort of idea like the one in MagiC where
processes are *killed* prior to (say) a resolution change?

>Anyone knowing a clean AES-method for this?

Only the usual one - send each application a shutdown message keeping

your fingers crossed they all respond.

>Otherwise a tricky solution
>with GEMDOS/ BASEPAGE would help me, too.

Is there a SIGABORT type signal? Perhaps you could hack the process id
and issue it to each process killing them that way? Dunno really - a
wild guess!

Respond? Uh-oh ... I thought sending an acknowledgement
caused an error, so I merely cause the application to exit
when it receives a shutdown message from the pipe.

Has anyony played with the file format of Spectrum (SPU)? I'm curiors
on how it's formatted. I have a short description but it doesn't
explain how the palette data is formatted.

Also, how does it display on the screen? Does it break the screen up

into threes? I have a C program that claim to return the index but I'm unsure how the display works. Thanks.

Hi all,
I Happen to have a non-functional Atari 600XL. I have used a Universal Device programmer to test the individual logic ICs and was able to locate one bad IC. However, just replacing that one IC did not work. Further investigation revealed that the OS prom was getting really HOT. I popped out the OS prom and read it with a Universal Device programmer which revealed no data (i.e. the prom was dead). I have been searching everywhere on the web for the 600XL's original OS binary file so I can program a 27128 EPROM and get my machine back up and running (to no avail). Would anyone happen to know where I can get this file or where I can get a comparable OS that would let me boot up into BASIC? If anyone out there has one of these machines and access to an EPROM/PROM reader, could you possibly copy the OS prom to a binary file and send it (email) to me? The part number on the OS prom is CO615988B.

Any help with this would be greatly appreciated.

Best Regards,
D.J. Hatfield

There's an ACC, DIR_2000, which will read a directory and gives the
option of display/print/write an ASCII file- options include how much
information about each file or folder you want including. You would have
to edit the result for your particular requirements.

Ay, there's the rub! I have been using Hisoft C (interpreter) for some
time, having decided it's about time I moved on from Modula-2, but it
doesn't like my Falcon AB40 (it's very unforgiving about non-standard
screen resolutions) and very slow for serious work. I have obtained
Lattice C (compiler), and followed all the instructions I can find about
porting Hisoft C programs- "Normally fairly simple, requiring few
changes to the source code" it says. The problem is with the Hisoft C
toolbox- at link time, all the routines I use from the toolbox report as
missing. Anyone sugest what stupid mistake I am making?

Hisoft no longer provide helpline support for Lattice C- the people who
know about it left last year.

Well I'm using the normal STOS sprite commands for now because it is
nothing major and does not require alot of speed e.t.c. I tried this but
the problem is not that the sprite leaves behind a trail as it falls but
the problem is the sprites backgound color. Such as if I had the letter O
I want ot be able to see what is underneath the O through the center.
Therefore, I need to sprites background color to be see through.

Scott.

Hi everyone,
it's the irritating Dutch bloke without a Compendium again,
with two little GEM related questions:

I've been working on a new (more or less OO) dialog handler/manager for
a while now, but ran into a few problems yesterday with the keyboard
input handler...

Firstly, what is the best way to get the ASCII value of a key when
pressed simultaneously with ALT? I'd assumed that the ASCII value
would be returned in the low byte after an event, but to my surprise
I only got the scancode back, and 0 for ASCII. I think I'm beginning
to understand why people have language incompatibility problems
with ALT+[key] combinations... Anyway, what is the best method to get
the ASCII value of [key] in this case?

And secondly, I can't get objc_edit() to work. It should be simple
enough, but no matter what I try, nothing seems to happen. I can't pass
any keys, I can't even get a cursor... I use Sozobon's XGEMFAST
lib and call objc_edit() in what I think is the correct manner:

```
objc_edit (tree, obj, key, &pos, mode);
```

First with mode EDINIT (same as ED_INIT, depending on which lib is used)
to init the edit field, then with EDCHAR for each character entered
into the field (scancode stripped for valid ASCII chars),
and finally with EDEND on leaving the field...
I checked the input values, they seemed fine, and the return value
was 1 in all cases (which means that there was no error).
Anyone got a simple working example or can tell me what I could be
doing wrong?

Thanks,

I would guess that the data is in standard ST palette format. Assuming that
you got you info from "ST Picture Formats" by David Bagget, look at the top
of the file. The palette format is in the Introductory Information.

: Also, how does it display on the screen? Does it break the screen up
: into threes?

Hmm, from what I can remember, the display routine "simply" changes the
palette three times per scanline.

Try

```
  KEYTAB *key_tab = Keytbl((void*)-1,(void*)-1,(void*)-1);
  unsigned char ascii_value;

  evnt_multi(......,&key,&key_shift,...);
  ascii_value = key_tab->unshift[key>>8];
```

?? MiNT relies on GEMDOS, so it won't recognise drives beyond P unless
you install something like BigDOS or perhaps MetaDOS (not sure about
MD).

I believe the low byte contains the ASCII value for a few ALT key
kombinations. So I'd suggest to check for a zero, and use the value
if it's not zero, and do something different otherwise. I'm not sure
though what would be the smartest thing to do in that case.

That's about correct.

Dunno. Maybe you should post a piece of your source code. I never had
problems when using objc_edit().

Cheers Peter

Have the external TOS program launched parallel, i.e. non-blocking. Before launch, Fforce() it's stdin and stdout into pipes, the other end of which are read/written by the launching program and displayed in a window.

Ah, this would explain a lot. I had been under the impression that
MiNT replaced the WHOLE OS (like Magic). So ..I just need a better
DOS.

That might be a sensible way, but maybe not what Levien was asking for. That table contains the codes for the keys without any of Shift CTRL or Alt keys, while he explicitly asked for the kombination with Alt. The XBios Keytbl does not provide access to Alt kombinations.

Cheers Peter

: problems when using objc_edit().

These are the two routines that deal with objc_edit(), for now (the redraw routines might also want to do so as soon as I can get this to work...)

The problem is simple: nothing happens. No cursor, no input...

```
/* Compiled using SozobonX version 2-point-something and XGEMFast */

/* Set new editable object */

short new_edit (XDIAL *dial, short obj)
{
    /* [Stuff removed] */

    if (dial->tree[obj].ob_flags & EDITABLE) {

        if (curr_ed_dial != dial) {     /* Disable editing in old dialog */
            if (curr_ed_dial->obj_edit >= 0)
                objc_edit (curr_ed_dial->tree, curr_ed_dial->obj_edit, 0,
                           &curr_ed_dial->edit_pos, EDEND);
            curr_ed_dial = dial;

        } else if (dial->obj_edit >= 0)     /* Disable previous field */
            objc_edit (dial->tree, dial->obj_edit, 0, &dial->edit_pos, EDEND);

        dial->obj_edit = obj;       /* Set new field */
        dial->edit_pos = 0;         /* Reset cursor */

        objc_edit (dial->tree, obj, 0, &dial->edit_pos, EDINIT);
        return (obj);

    } else
        return (NO_OBJECT);
}

/* Parse keyboard events */

short Xdial_ParseKeybd (XDIAL *dial, short key, short ctrl)
{
    /* [Lots of Stuff removed] */

    if ((key || raw) && dial->obj_edit >= 0) {
        if (dial->tree[dial->obj_edit].ob_flags & EDITABLE) {
            objc_edit (dial->tree, dial->obj_edit, key, &dial->edit_pos, EDCHAR);
        }
    }
}
```

I'm making a little electronic assembly (made by me!) and I'd like to use
it with the parallel port on my atari (1040ste).
So I gonna make a program with the gfa basic 2.0 and I'd like to know how
to :
1) get the condition of a pin
2) set or reset some other pins
I think it's feasible with peek and poke.

Dearest Peter, this is what he asked for:

>Firstly, what is the best way to get the ASCII value of a key when
>pressed simultaneously with ALT? I'd assumed that the ASCII value
>would be returned in the low byte after an event, but to my surprise

>the ASCII value of [key] in this case?

So what he wanted was the ASCII value of `key', and I gave him a neat
way to get it. The ALT value can simply be gotten from key_shift after
a keyboard event.

I don't see any key or event values passed to this function, nor is there a key value passed to objc_edit, so I get the the itchy feeling that you're not in an evnt_multi() loop. You do realize, I hope, you have to be in an evnt_multi() loop and call objc_edit() for each keyboard event?

While trying to finish up fVDI v0.85, I've run into problems with two applications: CAB and AtariWorks. For some reason, those two programs insist on drawing text on _very_ widely separated lines under fVDI (well, AtariWorks is usually OK with a file that has just been loaded, but as soon as I try to change anything, things break down).

I'm pretty sure I've got all the normal character and string size functions right (after all, no other program I've tried exhibits these strange problems), but perhaps there's something I might have missed? Strange as it may sound, I have very little previous experience with the VDI.

If anyone has any ideas about what might be going wrong (or have some similar program (doing 'advanced' text output) and would be willing to test it with fVDI), please let me know.

There's no use trying to test this with fVDI v0.84, since that is nowhere near as good as v0.85 at these kinds of things. There is a small archive (only engine and monochrome driver) of fVDI v0.85c on my ftp site (/pub/Other/fvdi_085c.lzh), however, which is only a week old. If you attempt to use the newer fVDI, please get in touch with me.

It SHOULD but it does not ! The fact is that the MiNT's memory
protection si lame, and it doesn't protect a lot ! If you have a NULL
pointer problem, try to look at YOUR program first.

I don't think you'll be able to do this with peek and poke, but you should
be able to do this with INP(1) and OUT 1,xx. Another thing you can't do is
find out if there's a character waiting to be read from the port, although
you can see if it's ready to receive one.

The most obvious one is a link problem - essentially not specifiying
the object library which contains the functions. Probably the best way
to start figuring this out is to take the simplest Hisoft program
you've got which is failing and make a note of the function names that
fail to link with it under Lattice. I would be surprised if things
such as printf() were failing to link for instance (unless you've made
some wierd alterations to Lattice without realising). With Hisoft
being interpreted it wouldn't suprise me if the "ease of use"
philosophy extended to linking also, so it may be pulling in library
functions that do not exist under a "standard link".

I don't use Lattice but I'll explain how Mwc does it which will get
the idea across ...

Mwc has four separate object libraries. The standard one contains
"standard functions" such as printf(), malloc(), memcpy() etc - all
the things common to a C compiler on any machine. Lattice probably has
similar.

There is also a maths libray which has to be specifically linked by
me. If I forget it then such functions as tan() ans sin() fail to be
resolved at link time. Lattice probably has similar.

The two other libraries are to do with Gem. One is a library
containing all the VDI function calls. The other contains all the AES
function calls. Again, I must specifically tell Mwc to scan these
libraries during a link other such functions as v_gtext() or
appl_init() will not resolve. Lattice probably has a specific option
for linking Gem programs within the workbench.

The most important two things to check are these ...

a)
The path to the object libraries has been specified correctly. I dunno
how you do this. It might be specified in the project file or you
might set a variable in the workbench. I can't help with this as I use
a 'makefile' with Mwc. I believe Lattice can do so also but iirc this
feature is nowhere near as easy (or desirable) to use as a project
file within the workbench.

b)
That the project file being used is valid.

Finally, I assume there was an original installation program. Check
the options on this as it might have been possible to install in such
a way that the libraries never got transferred.

In any case, a list of some of the unresolved function names will help
us sort it out.

>Hisoft no longer provide helpline support for Lattice C- the people who
>know about it left last year.

Hmm, that's a shame. Pity they couldn't have posted their support docs
as public domain.

Terminating quietly is the correct "response". You only need to reply
(with AP_TFAIL) if your application cannot shut down.

Sorry my wording worried you! ;-)

Some depressing info ...

I spent weeks and hundreds of lines of code (for each attempt) figuring out the best way to add this feature. It had: user defined console size, font changes anywhere (and wrap round correctly if desired), attribute changes anywhere, foreground and background colour changes anywhere, and the whole lot was overlayed onto a standard Gem OBJECT tree where the console was defined to be the area covered by one of the objects in the tree. As any object could have a console it was possible to have multiple consoles per tree. I got to the stage where I was ready to write the final version, combine all these features together and add it into Pug - which would have meant the object tree was automatically windowed and was active (ie buttons would work etc) as well. The consoles would have been used via a printf() type function call to pug using escape codes to implement the features.

I asked for Lattice and PureC techies in order to iron out any problems of those compilers calling Mwc object code. I got zero responses, so no release could be made. One night I binned the console code in disgust.

... told you it was depressing.

It may be, but the thing to watch out for is what peek and poke
actually do. They may result in multiple accesses and thus have side
effects! A tiny bit of assembler would be safer.

Are the lines double spaced? Might be a "single pixel" problem. If
perhaps, fVDI is returning info where it is a single pixel out it
could be causing those programs to insert blank lines.

Gut feeling on my part is some sort of character cell issue but there
are 101 ways that could arise.

>I'm pretty sure I've got all the normal character and string size
>functions right (after all, no other program I've tried exhibits these
>strange problems), but perhaps there's something I might have missed?

Likely. The interaction between vqt_extent and vqt_font_info can be
quite complex for instance, especially when using "special effects".

>Strange as it may sound, I have very little previous experience with
>the VDI.
>If anyone has any ideas about what might be going wrong (or have some

Can you be more specific about what 'advanced' text output consists
of?

>and would be willing to
>test it with fVDI), please let me know.

If you can describe the attributes of the problem line(s) well enough
then perhaps I could cobble together a small program to send to you -
hopefully it will "screw" up as well. The bug should then be pretty
easily located as you'll be able to use a debugger on fVDI whilst
following my source code.

Don't bother. I only ever saw one CLI acc (years ago) and it didn't
work very well. The way accessories work with the system makes this
sort of thing nigh on impossible. :-(

If you must have access to a CLI while running another app then I
suggest you purchase MagiC. It has a window driven VT52 emulator
application which quite happily runs my command line driven MWC
compiler (and multiples thereof).

There's a newly started Basic tutorial in Atari Computing, and this would probably be a good place to start. You can also order the Atari Computing cover disk that included HiSoft Basic.

We're at cross purposes here. ;-)

I meant a printf() kind of form_print() where you passed a text string to the function and it displayed that string. With this in mind you can see why I mentioned the control codes (CR etc) below, to implement some limited text processing.

>In addition, form_progress() would also lend itself to
>file downloading operations, user-decision/timeout
>activity, file format translations, and other
>hey-I'm-working-on-it / wait-until-I'm-finished
>situations.

Yep. I was thinking of a textual "progress" form.

>>If you think about it, even if form_progress only
>>dealt with single lines you would still have to have
>>the ability to "word wrap" just in case the text
>>string was too wide for a particular resolution.
>
>Display text used in form_alert() is limited to a
>maximum of 30 characters per line, IIRC, making
>word-wrapping unnecessary.

The 30 char/5 line limit is nothing more than a cop-out by Atari. More on this below.

>Using the same
>prompting mechanism in form_progress() (with an
>added progress bar, of course) would work in all
>resolutions, all the way back to ST low for those
>who enjoy looking at large, readable characters.

They could have implemented form_alert using a scrollable text area of user defined size: the system could have downsized this where it won't fit a given resolution and autowrapping would take care of the line length.

>As a bonus, using the same construction from a
>programming standpoint would lessen the confusion
>(and potentially reduce space demands on the RSC
>file) that occurs when two similar calls implement
>identical functions in different ways.

Due to the blocking nature of form_alert I really only use it for 'critical' errors. Given a file write error say, ideally you would want to display something like this...

Tos error number ??
{error message}

{filename}

... and as we need space for 30*5 chars plus a trailing nul plus the line break char (max 4 * '|') we need 155 chars workspace (assuming your limits are correct - I can't remember offhand and it doesn't alter my point anyway). Then we have to figure out where to insert the '|' so that no line is over 30 chars, only this looks messy so we need a better algorithm which attempts to insert the '|' over whitespace chars (if we can).

In my case I have no idea how long {error message} is going to be as I obtain it from errno.h not from the resource file. That aside, we have no idea how long {filename} is going to be either. The total could exceed 155 chars and we are in trouble.

Thus as far as I am concerned, sticking to the limits presents me with more difficulties than rewriting form_alert from scratch (which I have done)!

>>This in turn requires the generation of an object
>>tree on the fly so that the required amount of
>>G_STRING or G_TEXT objects could be generated -

>which can display an icon (if desired), 1 to 5 lines
>of programmer-supplied text, and 1 to 3 exit buttons
>(one of which may be defined as the default exit by
>the programmer).

This can be done with a dynamically generated tree.

>It's not necessary to open a window to display a
>form_alert(), IIRC,

That is correct.

>and I don't envision opening a
>window to display a form_progress() although a
>window-like handle might be needed to handle updates
>to the progress bar (i.e., 100, 237, 862, all the way
>up to 1000) since the form is supposed to be non-modal
>in nature.

There are two ways of looking at modality. A given object is either modal to an application or non modal to an application. With the former, the application will block until the modal object is removed. With the latter the application may continue reguardless.

The "form" library is useless in this respect because it is neither. In essence it is modal to the system and causes all applications to block the moment they attempt to perform a visual change. This is why

your form_progress needs a window!

>Does form_alert() really generate an object tree
>on the fly?

I doubt it. Otherwise it would not be as limited as it is. I would
imagine the AES has a single "fixed" tree containing the maximum
required objects then simply unlinks those which are not visually
required from the tree.

>>Having gone to this much trouble you might as well
>>add in the ability to process simple control codes
>>such as CR,
>

I meant that if those codes occured in the text string they would be
interpreted as simple control codes.

Hi,

I'm developing a Pearl90 compiler on my Mint-ed Falcon030 with gcc. I have FreeMint 1.12. Now, when I execute the [Pearl] compiler on certain sources (which are meant to stress my compiler), Mint totally blocks. The cursor stops blinking, no more disk activity, virtual consoles don't work anymore... Is it possible that the Mint kernel itself crashes ? I suspect my problem is triggered by some NULL pointer somewhere, but I have memory protection, so normally it should be caught, no ?

Start sending those comments, please !

Hi,

there is a german book 'ATARI ST Profibuch', which explains the cardridge HW
and how to write a program to make it run from there. Maybe the book was
translated to english ?

The books number is ISB N 3-88745-501-0 from SYBEX, Authors Hans-Dieter
Jankowski, Julian F.Reschke, Dietmar Rabich

maybe this helps

greetings

I think you need more values in the DATA statement. DIM a(2,2) would allow 0,1, and 2 in both directions. You can either add more values or add MAT BASE 1 at the top of the program. It depends on if you need the '0' element or not. Hope this help...

Why is the clipbrd need to be totally emptied when copying to it?

Example, in my prog I dump some info in the clipbrd.
A user (with the help of the compendium) told me that I should erase the whole content of the clipbrd folder (scrap.*).
I find this a little stupid, and can find any good reason. Anyone has a logical answer to that? so I THEN migh follow that way of doing.

Also, should I lock the clipbrd folder when using it from my code? if yes, why? (considering that it is running under MiNT).

Thanks

I have an ancient atari book somewhere that has some details on
hardware and software. The downside is it was badly proof-read and has
many errors (although for all I know the cartridge info may be fine).
I could root around for it if you want and scan the relevent pages?

Tried using RESTORE before MAT READ? After one read the internal pointer is pointing to next unread value and next read would cause a "Out of data" because there's no more DATA to read. e.g. this won't work

```
DATA 1,2,3,4
DIM a(1,1)
FOR i=1 TO 10
  MAT READ a()
NEXT i
```

but this will:

```
just_a_label:
DATA 1,2,3,4
DIM a(1,1)
FOR i=1 TO 10
  RESTORE just_a_label
  MAT READ a()
NEXT i
```

"just_a_label" is a point where the next READ will happen.

Haven't tried these...

Actually, Face Value (http://home.sol.no/~veg/faceval.html) comes pretty
close to being a kind of "Visual Basic", using GFA Basic. Version 2 is
released, but the website is not updated yet.

I haven't found much deviations between the ANSI standard and Pure C.
I think it is save to call it an ANSI C compiler. It is at least
not a K&R compiler.

Bye, Hans

Sure. It's on umich or one of it's mirrors. From Europe you'd best
try this one:

ftp://ftp.doc.ic.ac.uk/Mirrors/atari.archive.umich.edu/Programming/gemdos.arc

Which is a shame, because people who have it tell me it's even better
than the Compendium on several aspects. Still, while my german isn't
as good as it was in high-school, I can get by... anyone selling their
copy of the Profibuch, by any chance? ;-)

If this is specifically a MiNT app, might as well use /tmp instead
of the Clipboard..

Its been a LONG time since I touched standard STOS sprites, so I'm a little shakey on how they work...

> >Well could'nt find and transparent in the manual or a blit :(However I
> >now know around what lines I'm looking for.

It sounds like you are using the standard STOS sprites (most people dont anymore, as extensions such as TML give MUCH faster sprite routines), so here are a few commands to look up: "sprite", "autoback", "update", and "screencopy".

TML's "bob" command gives much better performance, but restoring the screen is harder

> I don't use STOS either ...
>
> A 'blit' (Bit Line Image Transfer iirc) is simply the term used in the
> Gem world for copying an image from one place to another.

Yes, there are various "blit" commands - STOS's command is called "screencopy", although the blitter extension, Misty, and The Missing Link all provide blit-type instructions under various names (as well as the Falcon aware copy in my extension).

> A 'transparent' blit is such a copy performed so that the image
> background remains the same. That is, we're talking "OR" mode.

When drawing sprites via the "sprite" command, STOS always automatically respects a transparent background.

> Look at the STOS command which is moving the images (sprites) and see
> if it has a "mode" parameter. If it doesn't then you might be using
> the wrong command. Assuming the command is correct then you could have
> to look at the sprite foreground and background masks (if such items
> exist).

They exist, but the STOS programmer doesn't get to see them while writing
the code. If using standard routines, it should handle a certain amount
if it for you. The important bit with STOS is the "back" and "logic"
screens (draw to logic, restore from back, and physic [sometimes same
as logic] is what is displayed on screen).

Sure, but there is no performance benefit. Still each application that needs
this has to employ it's own evnt_multi() thread, so the same kind of system

blocking occurs if several such programs run at the same time.

The situation would be eased though if all such applications could query a common program for doing this, so that only that single program needs to do evnt_multi() with MU_TIMER all the time. However, it's *very* unlikely that a significant portion of programmers would achieve to agree on such a mechanism. This would be different if it were built into the OS.

Cheers Peter

Chaos. There is very good reason why Atari strongly discouraged use of
Physbase, Logbase and Setscreen. Also, it's not portable, i.e. won't work
on most modern machines.

You'll have bad luck. Accessories may not launch other programs under
SingleTOS, this is due to OS internal limitations. So you won't find any
such thing that works reliable.

Go for true multitasking, you'll like it ;-)

A little while ago someone mentioned that he's working on a library for
both GEM and X-Window that would make an X program out of a GEM application
by just recompiling. Dunno how far he's got.

> Why is the clipbrd need to be totally emptied when copying to it?

It isn't. Only all files matching "SCRAP.*" need to be deleted. Reason
is data consistency. What do you expect a both graphics and text tool to

insert from the clipboard, if some (other ?) graphics tool copied some graphics (SCRAP.GEM) into the clipboard but forgot to delete the text (SCRAP.TXT) that was copied there before by a text editor ? Ambiguity is even worse if a word processor wrote some SCRAP.RTF and a text editor writes a SCRAP.TXT but does not delete the RTF.

> Example, in my prog I dump some info in the clipbrd.

It is not stupid but absolutely necessary, see above.

> a logical answer to that? so I THEN migh follow that way of doing.
>
> Also, should I lock the clipbrd folder when using it from my code? if
> yes, why? (considering that it is running under MiNT).

Probably not, I guess it is not the purpose of the clipboard to get some SCRAP file and then get locked so that no other program can access it.

Hi, out there!

I posted this once already, but didn't get a response. So next try:

For a shutdown master I urgently need to know the full names (including path) under which other running AES-applications were started. I already know their AES- and MiNT-IDs.
Anyone knowing a clean AES-method for this? Otherwise a tricky solution with GEMDOS/ BASEPAGE would help me, too.

Thanks!

: Why is the clipbrd need to be totally emptied when copying to it?

: Example, in my prog I dump some info in the clipbrd.
: A user (with the help of the compendium) told me that I should erase
: the whole content of the clipbrd folder (scrap.*).
: I find this a little stupid, and can find any good reason. Anyone has
: a logical answer to that? so I THEN migh follow that way of doing.

The short answer is consistency -- so that the clipboard behaves the way the user expects it to, the way it does on other platforms. Remember that programs using the clipboard are supposed to write out as many formats as they can to the clipboard folder when cutting or copying. Papyrus, for example, might write out SCRAP.PAP, SCRAP.RTF and SCRAP.ASC. Programs reading from the clipboard are supposed to use the format with the maximum information content. Now suppose I'm using EvereST to edit some code which I'm going to insert in a Papyrus document. EvereST will write out SCRAP.TXT or SCRAP.ASC to the clipboard when I'm transferring the code to Papyrus. What happens if EvereST _doesn't_ erase everything in the clipboard folder? There might still be SCRAP.PAP and SCRAP.RTF from previous use of the clipboard by Papyrus in the folder. Papyrus will load these, rather than the desired SCRAP.TXT/SCRAP.ASC, since they contain more

information, but that's not at all what I would want in this
no-so-hypothetical situation.

: Also, should I lock the clipbrd folder when using it from my code? if
: yes, why? (considering that it is running under MiNT).

Why bother? I just checked the man page for flock() (to "apply or remove
an advisory lock on an open file"). Since the locks are advisory, they are
not enforced by the OS; if programmers don't check for them, they can be
ignored, and will be ignored by every non-MiNT-specific application.
Also, it's hard to imagine a situation where two processes would be
accessing the clipboard "simulataneously", since every action with respect
to the clipboard takes place at the behest of the user, and the user
interacts with only one application at a time.

THeo

The world's first palmtop computer! The Atari Portfolio runs MSDOS applications and comes with a suite of built-in software including calendar, addressbook, text editor, Lotus-compatible spreadsheet, and file-transfer utilities. Plus there are plenty of third-party shareware apps, including games and productivity tools, available for download. This package includes the Atari Portfolio, a parallel port adapter so you can hook it to your desktop for file transfers, a 64k storage card, manuals, and AC adapter. This is a real collectible! Buyer pays shipping. For more info on the Portfolio, check out this page:
http://www.ncsc.dni.us/fun/user/tcc/cmuseum/Portfoli.htm

The auction is at:

My (rather stock) Falcon is a bit too slow to play say more than 4 or five voices at the same time with velocity (or medium) in action. I need to go back to the 'cut' option and then it's ok.

AB040: the word that kills (even the thought empties my purse ;-)). Maybe the forthcoming 'Centurbo 2' will give some punch to My Falcon. It'll be less than the price of an AB040...

Bye,
/Pascal/

Bonsoir,

Dans l'article <6jem7t$mvq@balaena.bio.vu.nl>,
Levien van Zon, <lvzon@bio.vu.nl> a ⍰crit :

⍰⍰: Has anyone ever attempted a port of a GEM program to X11 Windows
⍰⍰: and/or Windows 95?

I'm doing that now, for X11 R 6.
For the moment, it's mainly a kind of common library for GEM and X, based on GEM & VDI. But it should be possible to complete it so that one could directly use GEM functions [in fact, a few of them are already made, as menu_bar, rsrc_load or evnt_multi [partly]].
For an example : see

http://www.eleves.ens.fr:8080/home/curis/anneau.html [in French...]

where you can download
- the GEM version of the programm [exafs.zip]
- the X code of it, ready to recompile [well, if everything is ok :-)] [XExafs.zip]

so you can compare :-)
The only big thing currently missing [for the needs of that programm... that means, in that common-library] is the file selector.

For the moment, the X version has been tested on falcon/linux, Sparcstation/SunOS [machine I use to develop], SGI Indigo II/Irix, PC/Linux & DEC-alpha/linux.
Currently in development, so don't expect too much :-)

For more informations, please ask...

For the Win95 version⍰: if somebody wants to adapt, I'll be very happy :-) [I think W95 programming is closer to X11 programming than to GEM programming, but I'm not sure...]

⍰⍰A while back I heard rumours about a library for X designed to port Atari ⍰⍰programs. Sort of a GEM implementation on X. Anyone know if this exists?

May be it answers your question (ever if I don't know if it's this one you're speaking about...)

Okey. I don't know where the limit is on my computer but it's higher than that.
With EXPAND I can atleast play more than 16 voices if I use 8-bit sounds. If I
use 16-bit it lowers a bit.

> AB040: the word that kills (even the thought empties my purse ;-)). Maybe

Yes that should make a huge difference as well if it ever gets released.

My understanding was that the ST didn't really have sprites and that it
was just emulated in the software.
(perhaps to take advantage of a later hardware upgrade?)

There was a Dutch version of the old Profibuch. I have got all versions:
1 old German
1 dutch translation
2 new German
One new German copy is at the university, the old and the new German
are at home and the dutch version is at my parents home. So I always
have a reference manual to the Atari at my elbow.

Just wondering, WHERE can I buy the new german version?

Thanks.

Erm, it is true that the ST doesn't have hardware sprites (although line-a, part of the OS of older machines had sprite routines), but the question was specifically about sprites in STOS - a games programming language - which provides sprite routines.

Here I go again. I'm having no luck looking for the code examples for spectrum. It's really depressing that I lost the code I had years ago. I used to have some code (which I modified) that would allow you to draw in spectrum mode in GFA. You could create graphics on the fly. I modified it for several routines to animate and rund super color graphics.

I wish I could remember where I got it from (a magizine, BBS?) I wish I could find something simple (or write it) to handle rasters (like neocrome does.)

I've pretty well given up on the overscan (not that important really) but I still search for code examples using Spectrum. I have a displayer, but not one that can modify the graphic.

Maybe if I could create a spectrum-compatible file and display it! Ah that would be cool!

Could anyone help? Anyone played around with the old spec-tech or with rasters? I'd love to be able to raster a scan line and use the cool technique many games do for extra color.

-Thanks for anyone's wisdom.

I downloaded it and on first sight it looks great! I haven't studied
it in detail yet, or tried to compile it, but I most certainly will.

Is it all right to contact you if I have specific problems?

Thanks.

Bonjour,

Dans l'article <Esy650.nKs@suse.modem.stud.uni-hannover.de>,
Peter Rottengatter, <perot@pallas.amp.uni-hannover.de> a écrit :

>>A little while ago someone mentioned that he's working on a library for
>>both GEM and X-Window that would make an X program out of a GEM application
>>by just recompiling. Dunno how far he's got.

-> the part >>library of common functions for X & GEM/VDI<< is in good
progress. That means, if someone wants to start a new development and wishes
to make it usable on both X & GEM, I think he can use it.

-> the part recode the GEM functions is not really started, so just recompiling an existing soft doesn't work for the moment.

Anyway, a simple porting will never be enough, essentially because of some choices under X : each objetc is a window, which means that (for simplicity) changing an object size by OB_HEIGHT() won't have any effect till the tree is closed and reopened. One must use my own functions for that (that means, for instance, to do a slider...)

More details on demand...
See the address given in another message for an example.

AFIAK both the new and the old version are sold out. You will have
to find a store that has some still on stock.

The old Profibuch is the first edition, original title:
ATARI ST Profibuch
The new profibuch is called:

ATARI Profibuch
ST - STE - TT
The books were re-printed at least 10 times as I have got the
tenth printing.

Bye, Hans

I picked up the newly-released Linux 2.0 for
Atari CD and discovered that it has the same
problem I've found on previous releases
(Toad, etc.). It's simple, really: you can't
load the Linux OS until you've got the Linux OS
already running.

In this case, it means I cannot even open the
folders containing the code! All I can do is
read the README files (using a German to English
translation program) that apologize for the fact
the instructions are not in English.

<sigh>

I've visited the various Linux-for-Atari websites,
and I'm pretty certain about the need for ataboot,
vmlinux, and newfilesys -- but they're not included
in an executable form for single-tasking GEM!

So I'm stuck. Again.

Has anyone else been able to install Linux 2.0 from
the CD, using only the CD?

Thanks!

Hmmmm ... this is hard to answer gently and effectively. Using a well-written program is easy, writing a well-written program can be very difficult.

You need to be aware of:

a) standard implementation techniques (does File, New open a window or clear the existing one?)
b) expectations of the program user ("it doesn't do what I mean!")
c) bugs in various versions of the operating system and how to squash them.
d) "features" in OS calls that don't work the way they're described, but in a manner that makes sense ... kinda.
e) how the programming language works.

My recommendation -- get a copy of HiSoft Basic for your computer, then hit the used book stores for an "Introduction to Microsoft Quick Basic" book (You'll find the two are AMAZINGLY similar...).

Read the book, do the exercises, and get comfortable with the language even though you won't be doing much windowing to start.

When you reach the point where you can comfortably define a project and program it to completion, you're ready for GEM. And with one of the "From Basic to C" books, you'll be able to use Lattice C (not one of the friendliest compilers out there, BTW).

It's been said that a programmer new to the windowing environment takes a year to become productive. With a bit of dedication, and the experience that comes through time, you'll be able to experience the joys and frustrations of programming on your own computer.

Just don't get discouraged -- take the successes as they occur, and you'll do just fine. Besides, we're all friendly in here and glad to help out.

Does this answer the question?

I see by the huge response to this message that there is either:

A. No modem software that was ever written.

B. It was written, but no one thinks it's important enough to say.
C. All Falcon owners who use newsgroups already have modems and just don't care anyway.

There was a software-modem under developement, supposed to run at about
14.4Kbps, but due to someone's stupidity, most likely Atari Corp. going

Jaguar and not really caring about anything else, it got forgotten. The product was one of many reasons to buy a Falcon in the first place. I beleive I once also heard that the developers wanted too much money for the product, and that was one reason for why it never got to the market.

I wrote K&R ANSI-C code only as I was taking classes in C/C++ and was supposed to use Borland's C++ which was a bit truoblesome when I had no IBM PC clone. I had a lot of problems that I can't remember, but I remember that you could get rid of some errors by moving your code some lines up or down, without really changing anything. Since there is a new version I beleive many of the v.1 bugs have been fixed, and it should be safe to use it now. I've already downloaded v.2 and will try it out as soon as I get time to, let's say in a couple of years ;)
    I remember all those hours with the lousy photocopied papers from the class, K&R's book on the C language, coffee (and more coffee) and my Mega

2ST hooked up in a clauset ... accessing drives an generating millions of errors on the dusty little screen. Today I barely have time to use my Falcon, and I've got so much problems with HD casings, drivers, OS's and so forth ... there is no longer time to do anything productive and creative with your Atari ... you need to upgrade ;)

BTW, do you know if Sozobon C runs under MagiC? ... Then I would definately run Sozo!

You need to do a transparent blit. Don't ask me how, I don't use STOS. Should probably be in the user manual somewhere. Look up "transparent" in the index.

Use either an offscreen bitmap (you'll need an EdDI compatible VDI,
either NVDI or use the VDI enhancer) or draw to the screen and then blit to
memory (not always a good idea...)

I've been trying to find extensive docs about the ST cartrige port,
but without much success. What I'm trying to achieve is to burn an
EPROM that would install as a read-only drive upon bootup. Ideas?

I thought that was the normal use of the cartrige port. Standard, I
mean, even if many other uses were made.

Exactly!
People also seem to forget that these things actually won't make programming
for Atari machines in general any easier. You still have to provide code
for all non-Wizztronics machines...

When it comes to hardware, I gave up on Wizztronics years ago (anyone else
remember the Barracuda and more recently the Hawk?), and we certainly don't
need (IMHO) any further OS compatibility problems.

'Ease of use' things belong in libraries, preferably shared ones.

>functionality that was not achievable up to now. An example what I'd
>really appreciate is a evnt_multi() extension that allows linking code
>that checks for additional events, similar to what MiNT does with it's

I agree that things like that would be useful, but only if they are
available in all OSes, or at least in a free one, like OAESis or XaAES
(or MiNT, fVDI etc depending on the OS level in question).

>This effect is not even achievable by linking own code before the AES's
>evnt_multi() call, but requires changes deep in the AES.

You should be able to get the same effect by using a multithreaded
application. Just let one small thread do the evnt_multi() and then send
the messages along to the main code via a pipe (which can then be used in a
select()) when they occur.

Not as nice as real AES-level support of course (and there will be some performance penalty (probably not very much)), but I think it would work.

Probably both A and C. I haven't heard of any such software, and from what I heard in the early days, it wouldn't be possible to practically make a modem that was fast enough to compete with serial modems. It would still take hardware to do it, and there's probably no business in it, since modems are so cheap nowadays anyhow.

This is what I've heard, and my oppinions. If anyone knows better than me, please tell. :)

The answer is yes it can be used as a modem if the software is designed for it. However alot of software written for the falcon relies alot on the dsp56001 and taxes the available power it has. If you use the dsp in the falcon as a modem for the internet instead of an external modem, jpegs and any other software that uses the dsp would be alot slower. Using the dsp as a modem would be a good idea if newer falcons are developed with a 040/060 cpu, a faster dsp 56002 66/80 mhz, and faster custom chips where the dsp would have the extra cycles to spare and less software would have to use it to make up for the slow cpu.

I think there's an XBIOS call the lets you alter the logical and physical
address of the screen, so you can draw on an "invisible" screen. At least
on the ST models.

I know about that solution, but I wonder if it is reliable under multitasking.
What if at least 2 applications make this call ?

Wow. I think I will find information about offscreen drivers in a NVDI doc.
What is the VDI Enhancer ? What is EdDI ? Extended Device Interface ?
Is it an official feature from Atari or a independent project ?

Thanks.

Does anyone know if there is a bug in the MAT READ x() command inGFA
Basic v3.6TT?

The following code stops with the error 'Out of Data'

```
DATA 1,2,3,4
DIM a(2,2)
MAT READ a()
```

Can anyone help (quite soon please)? :)

Robert Casey

DIM a(2,2) makes a table sized 3 x 3 and you only have data for 2 x 2.
Change the base from 0 to 1 or DIM a(1,1). I hope that MAT READ is
supposed to fill the array from DATA?

Thanks for the responses guys.

While it is doubtless that such software wouldn't make much (if any) money, I would be interested to see if it could be done. Shoot, my Linux friend is dying to get his hands on my 1040STe to try some new Linux variant on it. He's just wants to see if it's possible!

I wonder... If it were written, how would you connect the Falcon to the phone line? I suppose you'd have to build a DSP interface. Or was there something else in mind?

There was a special interface that fitted the DSP connector at the back of
Falcon. I tried to remember and I know that Atari let all the ST magazines
of the time know that they were just about to release 14.4Kbps modem
software. I beleive they got the product ready but then they let it all go
due to the price of it all.

: EPROM that would install as a read-only drive upon bootup. Ideas?

You don't say what area of the cartridge port you need to know about - do you want to know how to electrically connect the EPROM to the cartridge port, or do you need to know what to burn into the EPROM?

Well to look briefly at the hardware:

The ROM cartridge uses a 40-way edge connector and plugs into the ROM port at the side of the ST. 128K of ROM is available in the address range $FA0000 to $FBFFFF. Having never used the port I can't say precisely, but it seems that the ROM3 and ROM4 select (active low) enable one of two banks to be selected in order to access the full 128K of space, my documentation is a bit vague on this. Otherwise the port looks quite straight-forward.

And from the Compendium:

There are two types of cartridge - diagnostic and application. Since you're interested in the latter, I'll skip straight to that. Application cartridges should contain one or more application headers beginning at location 0xFA0004 as follows:

Name	Offset	Meaning
CA_NEXT	0x00	Pointer to next app. header or NULL if no more
CA_INIT	0x04	Pointer to app init code. High 8 bits have special meaning:

Bit Set	Meaning
0	Execute prior to disp. mem. and int. vec. init.
1	Execute just before GEMDOS initialised
2	Unused
3	Execute prior to boot disc
4	Unused

```
                   5         Application is a desk accessory
                   6         Application is not a GEM application
                   7         Application needs parameters
CA_RUN    0x08     Pointer to application's main entry point.
CA_TIME   0x0C     Standard GEMDOS time stamp
CA_DATE   0x0E     Standard GEMDOS date stamp
CA_SIZE   0x10     Size of application in bytes
CA_NAME   0x14     Null terminated ASCII filename in standard GEMDOS 8+3 format.
```

Unfortunately the Compendium does not explain exactly how the CA_INIT and CA_RUN entries are used.

The cartridge can then be accessed as a lower-case `c' drive, with the applications listed like ordinary files.

I see only one possibility when you use evnt_multi() to know if there is a message you must verify that evnt_multi()&0x10 is true and not verify evnt_multi()==0x10 that is fault.

I know in GFA BASIC phy%=xbios(2) returns the physical screen address and logic%=xbios(3) return the logic address. Perhaps (If your using GFA) you could use logic%=xbios(3) to return the logical screen address, then use then set that to the current active screen somehow. All thte drawing functions should go to the logical screen and not be seen. You could then get the physical screen up and running again by using the physical screen address. As a matter of fact you should be able to swap the physical address with logical.

Hello,

I am looking for a good command line interpretor in the form of a desk accessory. It would have to run external programs such as gcc, make, etc. and be able to set envioroment variables.

I know I could use Mint with toswin and a shell like bash but that is a bit too complex for my needs.

If anybody could send any information via email on such an accessory I would be very grateful.

Thanks alot, Robin Grant.

Frederic Dinh (frederic.dinh@hol.fr) wrote:

: Wow. I think I will find information about offscreen drivers in a NVDI doc.

Indeed. Try the NVDI v4 programmers guide (should be available from the Natural Born Programmers site, maybe on my site as well, if the link's still valid...)

: What is the VDI Enhancer ?

It's a little program written by the guys that did NVDI, to implement EdDI calls in existing VDI's (don't know if this'll work for all VDI's though...)
It's freeware and should be on most FTP sites...

: What is EdDI ? Extended Device Interface ?

It seems to be some kind of protocol or standard to inplement extended VDI features. It implements offscreen bitmaps, some new calls to get more info on workstations and a few other bits...

: Is it an official feature from Atari or a independent project ?

It's independant. It was implemented in NVDI and MagiC and can be added to older VDI's using the enhancer, so it's pretty well supported. I hope it will be added to FVDI as wel...

Yes, you would have to have some hardware. I don't know the details of
what would be needed, nor how to make the DSP program itself. I
believe Motorola's DSP56001 manual mentions that the DSP _can_ be used
as a modem, but I don't know if Atari's implementation in the Falcon
allows for this. They skipped out on some things, e.g. handshaked DMA
tranfers, which is supported my the DSP, but not the Atari hardware.
There are ways around that thing though, kinda. :)

I still think the most powerful is to have TosWin because:
TosWin can be used without MiNT. So not very complex, is it?

Yves.

Note: there is a new release of TosWin which cannot be used without
MiNT.

Both.
I'm aware of how to burn an EPROM already. However, I only have the
edge connector pinout from my user manual (no info about which pins
access which cartrige mode, for instance) and the incomplete coding
data found in the Compendium.

Seems you barely have more info than me.. <g>.
Thanks for your reply anyways! ;-)

Yep. I remember that drive letter. That's what I'm trying to achieve,
except I need about 2 Mb worth of memory. I guess I'll have to use those
128 Kb for the small application that bootstraps drive 'd'.

Are you using the STOS sprite commands or some from an extension (such
as the missing link)??
If you are using the standard STOS ones, then all you have to do is copy
your forground screen display into the background screen. This
background screen is used to redraw the bits in the foreground where the
sprites have moved over.
  e.g. screencopy logic to back
  should do the trick i think

Hope this helps

Modern Atari System Software (available still from HiSoft?) contains the
object file formats for Lattice, GST and DRI. I'm not sure how much of

the debugging information is detailed in here though.

Craig Graham created a MiNT based source-level Lattice C debugger, and both source and binaries are available from his WWW pages.

GDB sources are available, which should provide access to the GCC debugging structures.

I have a Lakmeyer EPROM burner (made in the UK) which came with "ROMdrive" software. I beleive this does exactly what you want to do, although I have never used it. It makes the cartridge appear as an open window on the desktop with whatever programs you have saved in the EPROM.

I also have a "Back Pack" cartridge, again from the UK, which included a set of desktop utility programs (calculator, address book, appointment calendar, etc.). I was pretty impressed with this cartridge back in the days of the 520 ST with only 512K of RAM.

There is also some documentation on writing to the cartridge port at Vezz's ST hardware web site. Sorry, I don't have the URL handy, but if you can't find it, let me know and I'll look it up.

BTW, if anyone else is familar with or has the Lakmeyer EPROM burner, I'd like to know what the latest version of the software is.

You could just set a flag then have another process (eg an accessory) poll that flag in order to decide if data should be written. In practice, it will probably involve implementing some sort of ring buffer of suitable size so that no data gets lost.

A (possible) MagiC solution ...

In the MagiC header file MAGX.H one of the system structures contains an "in_dos" flag. If this behaves in a similar manner to the flag of the same name used in the PC world then it *might* be possible to do it that way. If memory serves, the flag gets set when a dos call is being made and is cleared when dos is exited. This makes it possible for TSR's to make dos calls. They simply poll the flag until it is clear - then they know a dos call can be made without re-entrancy problems. This feature could allow an IRQ to make a dos call (subject to timing constraints etc).

Some compilers (Lattice iirc) use a specialised "EVNT_MULTI" structure
which is neater than passing all those arguments. It also allows the
compiler to stack the strucure a bit more efficiently.

Perhaps that was what was meant?

What sort of length are we talking about?

>Does anyone know if this is a known bug in the VT52 program, or could it be
>something I'm doing?

Either. I've had situations in the past where the program I'm developing appears to be ok whilst other apps intermittantly get kicked out and VT52 invariably bears the brunt of this as it is usually the parent process of my development programs. In almost all cases the bug has been mine - usually my prog corrupts some memory area belonging to another process which in turn may corrupt something else until the corruption reaches the point where MagiC picks it up, whereupon it kicks out the process which owns the corrupted memory block, rather than the one responsible for the corruption.

>If it's a bug, does anyone know if there is a more
>reliable replacement for VT52 under MagiC?

If memory serves, I did send my MagiC version 2 VT52 to someone (ah who was it?) with a later version of MagiC who had problems, and it solved it in his case.

>Thanks for any help,

On the assumption your app has no bugs then methinks the line length might be the key. Try fiddling with the refresh and buffering options and see if that has an effect (perhaps even try vt52 singletasking). We don't know the internals of VT52 so who knows, but it is feasible that if a given number of chars in a given font takes longer than a given time (iyswim) to be buffered/displayed then some internal limit may be reached.

You might also try MEMEXAMN at various stages in the crashes and hangs and compare them. This is the tool I used to figure out which process was at fault. Although a bit hit & miss you get lucky eventually!

Hi everybody,
I'd like to experiment SE protocoll. Where could I find a version of PCShell supporting this protocoll ? I tried some FTP sites but only found a version dating back to 94.
Thanks !

I have used the MAT commands however the manual states there is a

MAT BASE command much like OPTION BASE. I think a() would have the
range 0,1,2 for each dimension thus you don't have enough values in
your DATA statement. This would result in the error.
Try adding 2 more values to the DATA statement or adding MAT BASE 1
to the top of the program.

Hope this help...

I remember having to do that as well. Usually when I'd wanted a long value
returned, rather than an int. I think Sozo came out 'bad second declaration'
or something similar.

> I remember all those hours with the lousy photocopied papers from the

I've not witten anything that big, although I've managed something in the
region of a couple of hundred errors. Forgot to include a couple of
#includes at the start :(Put them in, added the ';'s that were missing
and no more errors (until it ran)

>   Today I barely have time to use my

The 'joys' of trying to use windows I gather. I think I'll keep what little
sanity I have just a bit longer ;)

>
> BTW, do you know if Sozobon C runs under MagiC? ... Then I would definately
> run Sozo!

It seems to do so here, in a nice little vt52 window. This is nice in that
I can leave the output window on screen and correct any errors that have
come up. The only trouble I've got is I don't have a debugger that will work
under Magic. 'Tis a bit of a pain when trying to sort something out. To
get round it I debug under TOS and then check with Magic just to make sure.

Hello all,

is it possible to do devconnects on different clock speeds at the same time, e.g. connect dmaplay to dsp on 22k050 and connect dsp to dac with 44k1 and let the dsp fill in the gaps? or is the dsp input freq always the same as the output freq?

do I have to use handshake mode to handle this correctly?

Try this ...

```
extern int16       gl_apid;

#define  SH_WDRAW 72
#define  WH_DESKTOP    0

main()
{int16   msg[8];
 int16   which    =-1;
 int16   apid;

 apid = appl_init();
 msg[0] = SH_WDRAW;
 msg[1] = gl_apid;
 msg[2] = 0;
 msg[3] = which;
 appl_write(WH_DESKTOP,16,msg);
 appl_exit();
 exit(0);
}
```

... and from the MagiC 2 manual ...

"The shell is informed by the application that the contents of a drive
have changed and so the shell window should be updated. The drive
numbers are specified in msg[3], whereby 0 zero means drive A:. If
msg[3] is -1, all windows will be updated by the shell. This message
is supported by MAGXDESK, EASE3 and GEMINI 2."

Note:
I've used 'gl_apid' as I'm not sure if Sozobon is one of those
compilers which mangles the return value from appl_init(). If it
doesn't then take out the 'gl_apid' stuff and use 'msg[1]=apid'
instead. ;-)

I don't use STOS either ...

A 'blit' (Bit Line Image Transfer iirc) is simply the term used in the
Gem world for copying an image from one place to another.

A 'transparent' blit is such a copy performed so that the image
background remains the same. That is, we're talking "OR" mode.

Look at the STOS command which is moving the images (sprites) and see
if it has a "mode" parameter. If it doesn't then you might be using
the wrong command. Assuming the command is correct then you could have
to look at the sprite foreground and background masks (if such items
exist).

>Electronic Cow and others, I want to learn a bit of programming.
>Unfortunately I know NOTHING.

If you have never programmed at all before then you might get put off
if you tried C first. This is because if you tell it to do something
stupid it will usually *do* something stupid simply because it assumes
you're the boss and know what you are doing. This is what makes it so
powerful - and so difficult to debug!

>Are there any essential bits of reading to do? On-line, or are there books?

Grab a few general purpose C and Basic books from a library and see
how you get on with understanding them.

>Should I be learning C, or some kind of Visual Basic?

If you mean 'Visual Basic' as in the Windoze equivilent then there
isn't one. There are Basic interpreters and compilers though.

C doesn't actually have many commands so it easy to learn the language
itself. Its power comes from the flexible ways it can manipulate data
and its ability to let you add your own commands (called functions) to
it so that they become part of the language. There are also an awful
lot of prewritten functions which you can use. Some of these are
"standard" ones (which a general purpose book will teach you) then
there are the non standard ones for accessing the Atari operating
system for example.

Thus, if you do choose C, any "standard" stuff you learn will be
useful on any Ansi compiler on any machine.

>What about compilers?

Generally, compilers are best for creating programs and interpreters
are best for learning to program. On the other hand I only know of one
C interpreter and it hasn't been supported for years.

>Where, in other words, do I start?

If you choose C then get an ANSI conforming compiler and some general
purpose programming books. You don't want anything "machine" specific
to start with. Just learn the stuff which is common to all C compilers
(which is all a decent general purpose book should cover). When you're
happy with that then try some Atari specific stuff.

>I'd really appreciate any help you can give me.

Lattice and PureC are the two Ansi compilers. You should be able to
get one second hand. The manuals will have most of the Atari specific
stuff in as well actually, aside from how to compile with the darn
things of course!

It's GFA Basic. I found it more 'comfortable' than Hisoft Basic. Not that
Hisoft was that 'uncomfortable', but with GFA, it's easier to see where
something mucks up.

That's basically how the final function looks. The bit I wrote was a (bad) example of how it worked. The snippet above is how the assembler version looks, more or less.

For those of you who have not seen the best disczine around send a E-mail to me and request issue 1 or 2.

If you have seen MEGA why have you not supported this new zine. There are lots of you out there who must of liked something in it. But you don't tell

us what you liked and what you didn't.

It only takes a moment to return the questionnaire, or to offer some ideas of your own. We need your support NOW. The more support we get the faster MEGA will be produced.

The MEGA member list is getting slowly longer but we need more feedback, We need to know that people are reading it and liking it, There would be little point in producing a zine if there is now one reading it.

So come on, Lets have some feedback, I want to make it YOUR zine, Let us know what your would like to see happen and the MEGA team will support your idea.

Why not send in something in, Ramble on about anything you like, We want to hear from you. Get your name added to the credits list at the same time.

I have mailed MEGA 1 and 2 to god knows how many people over the last month, Well, Ok, It has not appeared on my site yet, But you can get it now if you wish. Simply join the mailing list and you will get MEGA before it goes onto my site. Out of all those people how now have got it, only a handful have had any comments. This is good but we need more now !

Issue 3 WILL appear but how soon all depends on you. So get writing and send something in, or at least tell us what you though about MEGA. It only takes a moment so why not go for it, your not going to loose anything by sending a mail to me.

If you have seen UFOST by Lee Round then please support his UFO zine with you UFO related material. Lee is now in 2 minds weather or not to do issue 3 because of all of you how seam to be scared or writing a letter to him.

Hi,
I've got an Atari 1040 STF with an SC1224 atari RGB monitor and an external 20 MB Supra hard drive.
$120 buys it all.
Everything works, and is in very good condition.
And yes, I have the mouse.
Also, the monitor has built-in speakers.

You also get 3 years worth of disks from START magazine, a few games, and Mark Williams C compiler with manual.

Please mail me if interested.

You *need* an external clock : it's a small electronic device you plug on the dsp expansion port.

Hi, I have a prob with this:
My event_multi() IF mu_timer will not fetch all the redraw messages correctly.
If I remove the mu_timer flag, everything works fine.
Any idea why the aes gem message get messed up and not reliable?
What Am I doing wrong?

Well one think comes to mind. event_multi() may return multiple events
at once so you should check for every event everytime not just one.
e.g.

```
event = event_multi(...);

if (event & MU_TIMER) { ... }
if (event & MU_MESAG) { ... }
if (event & MU_KEYBD) { ... }
etc...
```

and not like this:

```
if (event & MU_TIMER) { ...}
else if (event & MU_MESAG) { ... }
else if (event & MU_KEYBD) { ... }
etc...
```

other than that I don't know...

Maybe you don't test all the possible return messages individually? The evnt_multi() function returns a bit array stating which conditions that were fulfilled, so a timer event may occur at the same time as your program receives a message.

I'm having problems with a .TTP program that I've written when it runs in MagiC's VT52 window. Every so often it crashes and the VT52 program then hangs and has to be killed.

This seems to be related to the length of lines being output, but I'm not sure.

All my program does is a Cconws of a string, and I suspect the problem is actually not my program, but VT52.

Does anyone know if this is a known bug in the VT52 program, or could it be something I'm doing? If it's a bug, does anyone know if there is a more reliable replacement for VT52 under MagiC?

Thanks for any help,
Gary

For those of you who have not seen the best disczine around Click on the links below and get disc 1 and 2 or issue 2 of MEGA DISCZINE.

If you have seen MEGA why have you not supported this new zine. There are lots of you out there who must of liked something in it. But you don't tell us what you liked and what you didn't.

It only takes a moment to return the questionnaire, or to offer some ideas of your own. We need your support NOW. The more support we get the faster MEGA will be produced.

The MEGA member list is getting slowly longer but we need more feedback, We need to know that people are reading it and liking it, There would be little point in producing a zine if there is now one reading it. This would be a great shame as there is now other zine like it.

So come on, Lets have some feedback, I want to make it YOUR zine, Let us know what your would like to see happen and the MEGA team will support your idea.

Why not send in something in, Ramble on about anything you like, We want to hear from you. Get your name added to the credits list at the same time.

I have mailed MEGA 1 and 2 to god knows how many people over the last month, Well, Ok, It has not appeared on my site yet, But you can get it now if you wish. Simply join the mailing list and you will get MEGA before it goes onto my site. Out of all those people how now have got it, only a handful have had any comments. This is good but we need more now !

Issue 3 WILL appear but how soon all depends on you. So get writing and send something in, or at least tell us what you though about MEGA. It only takes a moment so why not go for it, your not going to loose anything by sending a mail to me.

If you have seen UFOST by Lee Round then please support his UFO zine with you UFO related material. Lee is now in 2 minds weather or not to do issue 3 because of all of you how seam to be scared or writing a letter to him.

I have issue 2 ready for E-mail should you dare to ask for it. Sorry but it has not yet been added to my site, Keep trying though !!

Here are the URL's for issue 2.

You probably already know not to use a value of "0"
for both the high-time and low-time values used with
evnt_timer / evnt_multi(MU_TIMER) in a desk accessory,
right?

And you ARE using evnt_multi, not event_multi, right?

Thanks guys. I found the prob. Actually someone here gave me the clue
:)

Was just the way I was checking for the messages, It worked, but not
consistent, Now I use if event and mu_button for example, with all the
rest, and everything if caught properly :)
so thanks again.

(about the event_multi() and evnt_multi() yes, of course, well, As I
said, it worked, but not consistent if I added the | mu_timer, so if
my mistake was that big, I think it wouldn't have worked at all :)
bye

Nope. There are lots of stages involved though and if any one of them
is deficient in some way then it may not work.

Firstly the keyboard processor must (a) posess hardware to detect the
third button, (b) posess the software to process such a third button.

Secondly the keyboard processor passes this information as keypress
codes. One is sent each time the mouse "changes" and they are caught
by a general interrupt routine which then dispatches incoming data to
the relevent drivers - keyboard, joystick, mouse etc. Thus the general
routine must be capable of detecting and dispatching these 'new' mouse
codes to the mouse driver and the mouse driver must be able to
preserve them.

The third stage is the VDI mouse handler. It must be capable of
handling the new codes and translating them according to the
requirements of the AES which finally will make them visible via such
system calls as evnt_multi etc.

In turn the applications being run will need to be able to process

them. Alternatively, as you suggest, if the third button is to be used to generate existing messages instead, then at some point between the VDI mouse handler and the AES, a message (such as WM_CLOSED) must be injected into Gem. This would require the "injector" to have access to both the active window handle, and the relevent application's message pipe - which may be impossible as these internals will not be known.

On the other hand, a suitable (say) accessory could make use of a 3 button evnt_multi upon which it could send a WM_CLOSED with the desktop id to the window under the mouse, which would fool most applications. This isn't a clean method however and can lead to problems.

I'm not saying >2 buttons is impossible - just that there are a lot of things which can get in the way! ;-)

That's a bit too specific, a 'form_print' could serve the same purpose. If you think about it, even if form_progress only dealt with single lines you would still have to have the ability to "word wrap" just in case the text string was too wide for a particular resolution. This in turn requires the generation of an object tree on the fly so that the required amount of G_STRING or G_TEXT objects could be generated - then you have to create and open a window of the correct size. Having gone to this much trouble you might as well add in the ability to process simple control codes such as CR, LF, CLS, HOME and (maybe) TAB. ;-)

I know that's not the current question, but I rewired a pc mouse to an atari mouse (trackball, in fact), and there was 3 buttons. Originally the 3rd button was used as a 'first button on/off'. It was managed by the microcontroller of the mouse. Some pc mouse use the 3rd button as 'first-double click'.
I choosed a new way : my third button is the "return" and I find it usefull for default (gem)buttons.
What I'm trying to say is : If a pc mouse is connected to a falcon's serial port (serial, lan, midi), the soft has to redirect the mouse messages as if it is form the original keyboard. This soft could propose several options to use the 3rd button.
Just an idea ...

Eric

Well, sure, you could have a special-purpose progress bar

alert box for printing operations, but a general-purpose form_progress() box would also work for printing functions just fine.

In addition, form_progress() would also lend itself to file downloading operations, user-decision/timeout activity, file format translations, and other hey-I'm-working-on-it / wait-until-I'm-finished situations.

>If you think about it, even if form_progress only

Display text used in form_alert() is limited to a maximum of 30 characters per line, IIRC, making word-wrapping unnecessary. Using the same prompting mechanism in form_progress() (with an added progress bar, of course) would work in all resolutions, all the way back to ST low for those who enjoy looking at large, readable characters.

As a bonus, using the same construction from a programming standpoint would lessen the confusion (and potentially reduce space demands on the RSC file) that occurs when two similar calls implement identical functions in different ways.

>This in turn requires the generation of an object
>tree on the fly so that the required amount of
>G_STRING or G_TEXT objects could be generated -
>then you have to create and open a window of the
>correct size.

It would be no different from the existing form_alert() which can display an icon (if desired), 1 to 5 lines of programmer-supplied text, and 1 to 3 exit buttons (one of which may be defined as the default exit by the programmer).

It's not necessary to open a window to display a form_alert(), IIRC, and I don't envision opening a window to display a form_progress() although a window-like handle might be needed to handle updates to the progress bar (i.e., 100, 237, 862, all the way up to 1000) since the form is supposed to be non-modal in nature.

Does form_alert() really generate an object tree on the fly?

>Having gone to this much trouble you might as well

How supported is Sozobon C today? Where can one find more info about the current version?
Back in the old days it took about the same amount of time to avoid Sozobon C's internal bugs that it took to troubleshoot your own ones ;)

Hello,
I need YOUR help.
I've been using my ST to make music for years. Now, having been inspired by Electronic Cow and others, I want to learn a bit of programming.
Unfortunately I know NOTHING.
Are there any essential bits of reading to do? On-line, or are there books?
Should I be learning C, or some kind of Visual Basic?
What about compilers?
Where, in other words, do I start?
I'd really appreciate any help you can give me.
Please mail me at screenstyles@hotmail.com.
Thanks,
Paul.

I'm having problems expanding .ST files using STTODSK.TTP.
I have placed my .ST file on a disk along with the application, and typed every likely command line I can think of.
What am I doing wrong? (on my 1040 STf)

please mail screenstyles@hotmail.com if you can help.
Peace.

And another thing...
I realise that TOS IMG files are used by people running ST emulators on PCs, but is it possible to create ST boot-up disks from TOS IMG files - to use as a kind of software TOS update?
Forgive me for asking what are probably bloody obvious questions. I've owned an ST + Cubase for years, but I've never seen an ST manual, and conquesquently I have some large and fundamental gaps in my knowledge.

Any illumination would be gratefully received at screenstyles@hotmail.com

Thank you.

Hi, everyone!

I've got a problem: For a shutdown-master for multitasking-OS like N.AES
I need to know the name including full path under which other running
applications/ accessories were started. Provided I know the particular
AES-IDs, can anyone give me a clean AES-method to achieve this?
Otherwise something with GEMDOS/ BASEPAGE would be fine, too.

Thanks already.

For those of you who have not seen the best disczine around Click on the
links at the end of this message and get disc 1 and 2 of issue 2 of MEGA
DISCZINE.

If you have seen MEGA why have you not supported this new zine. There are
lots of you out there who must of liked something in it. But you don't tell

us what you liked and what you didn't. There are a lot of people who have not yet seen MEGA so get downloading there or over 200 articles on the 2 discs with a nice shall which anyone can use without any info at all on it.

There are many sections in this zine, Some or 1 off and are very interesting to read, It would be impossible to list them all so heres a quick rundown.

True horror/ghost tales, STOS, Tesla, Electronics, jokes and humour, Dreams what they mean and stuff, get rich, UFO articles, stories, Anti car crime, Reviews, Returned questionnaires, Science, Black holes, and much more. Simply take a look and you will be amazed on what we have found for you. There should be something for everyone in issue 2. Lets here what YOU would like to see appear !!

It only takes a moment to return the questionnaire, or to offer some ideas of your own. We need your support NOW. The more support we get the faster MEGA will be produced. Anything you do will be included in issue 3 which is currently been done by the MEGA team.

I want to make MEGA "YOUR" zine, so tell me what you want and we will include that page in the next issue. Any ideas not matter who obscure or small they be, are more than welcome.

The MEGA member list is getting slowly longer but we need more feedback, We need to know that people are reading it and liking it, There would be little point in producing a zine if there is now one reading it. This would be a great shame as there is now other zine like it.

Why not send in something in, Ramble on about anything you like, We want to hear from you. Get your name added to the credits list at the same time.

I have mailed MEGA 1 and 2 to god knows how many people over the last month, Well, Ok, It has not appeared on my site yet, But you can get it now if you wish. Simply join the mailing list and you will get MEGA before it goes onto my site. Out of all those people how now have got it, only a handful have had any comments. This is good but we need more now !

Everyone who has sent me mail over the last few weeks has not been added to the list. If you would like to be added to the mailing list then please re-mail me so I can add you to the list. Please check if you have requested to be added to make sure you have been added.

Issue 3 WILL appear but how soon all depends on you. So get writing and send something in, or at least tell us what you though about MEGA. It only takes a moment so why not go for it, your not going to loose anything by sending a mail to me.

If you have seen UFOST by Lee Round then please support his UFO zine with you UFO related material. Lee is now in 2 minds weather or not to do issue

3 because of all of you how seam to be scared or writing a letter to him.
If you would like to send Lee mail, Send it to me but put "FOR LEE ROUND" in the subject box and I will be happy to pass it onto him. If your interested in UFO's or related stuff then request issue 2 of UFOST now, I regret it still has not been added to my site. Send me a mail if you would like a copy.

I have issue 2 ready for E-mail should you dare to ask for it. Sorry but it has not yet been added to my site, Keep trying though !!

Here are the URL's for MEGA Disczine issue 2.

ftp://ftp.funet.fi/pub/atari/mag/mega/mega2_d1.zip

ftp://ftp.funet.fi/pub/atari/mag/mega/mega2_d2.zip

Thanks to Deano for the upload of issue 2.

Hello All,
I have a C-Lab Falcon 030 with a Toshiba internal 2.5" 540meg scsi hard drive, and an external NEC scsi CDR-MV2 1x cdrom drive.
My problem is that when ever I boot my Falcon with the cdrom connected to the Falcon's scsi port, my boot partition gets scrambled and I end up having to rebuild the partition and reloading the files placed therein. I have tried 3 different external scsi cdrom drives and have replaced the cable all to no avail. Can anyone out there figure out what the problem is and let me know so I can rectify it and make use of my cdrom drive? Thanks! :)

Hmm, up to now I've only seen proposals that move frequently used stuff into the OS. Although that certainly is desirable, it is not an important

matter. I consider suggestions far more important that *ENABLE* new functionality that was not achievable up to now. An example what I'd really appreciate is a evnt_multi() extension that allows linking code that checks for additional events, similar to what MiNT does with it's select() call for files. Right now, an application needing to wait for some event needs to do so via polling and employing MU_TIMER, which is not efficient and blocks the system if several applications use this. This effect is not even achievable by linking own code before the AES's evnt_multi() call, but requires changes deep in the AES.

Cheers Peter

Of course it is, I wrote such a thing a couple of years ago. It was a nice exercise in parsing and recursive programming.

The keyboard processor knows only two buttons, i.e. two inputs. The button
you hook to the one is treated as the left, the button at the other input
is treated as the right button. No more buttons are supported.

You can connect a serial mouse to a serial port, but I do not know the
details how buttons are reported.

> And can anyone tell me on which machines the middle button works and on

AFAIK they all use the same keyboard processor.

> What about the new Atari clones, do they even have an
> Atari mouse port?

Probably not if they employ PC keyboards.

This is a tricky thing to do as neither GEMDOS nor BIOS nor XBIOS are

reentrant. With MagiC, they are, so you can call, say, GEMDOS from
interrupt; but this will work with no other system (not even MiNT !).

What you can do is link into the traps #1, #13 and #14 to set and reset
a flag indicating that a GEMDOS etc. call is being executed. Then, have
the end-of-buffer interrupt enable some code that is periodically executed,
say, from the 200 Hz interrupt. This code checks the flags mentioned above
and jumps to the floppy access code if neither is set, or does nothing
otherwise, until that periodical interrupt fires again.

You'll need to be very careful to make this code portable such that it
will work will all systems.

Cheers Peter

> What Am I doing wrong?

You might have fallen into a well frequented pitfall ;-)

evnt_multi() does return more than one event on occasion. So

```
   event = evnt_multi (MU_TIMER | MU_MESAG, ...);

   if (event == MU_TIMER) { ... }
   if (event == MU_MESAG) { ... }
```

is broken code and can produce precisely the effect you describe.
Use

```
   event = evnt_multi (MU_TIMER | MU_MESAG, ...);

   if (event & MU_TIMER) { ... }
   if (event & MU_MESAG) { ... }
```

instead.

Cheers Peter

ROTFL ! ;-)

AFAIK event_multi() is provided by some GEM libraries. Talking about the
AES, true, only evnt_multi() exists.

Cheers Peter

what is the best way of knowing how much TTram you have, not what's
left, but what's installed.
so far I am using a pointer to $5a4 then - 16meg, but it seems not
reliable on every case, example some TT with some g.card, not all
though!. very weird.
any idea?

FWIW, there is already such an adapter for the Amiga, called
"Topolino" or similar. Since the only difference between Amiga and
Atari mice are the pinouts (which is why most aftermarket mice are
switchable between the two), anyone needed such a solution tomorrow
could purchase a Topolino and wire up and adapter.

BTW, if you incorporate a switch into your device, you could market it
to both Atari and Amiga owners, something the makers of the Topolino
overlooked.

On the subject of third button support, it would be nice if support
for the "fourth button" some mice now have (usually on the side, like
the current top of the line Logitech mouse, and the newest version of
the inexpensive Genius Netmouse), as well as scroll wheels. About the

only way I could see to support that, however, would be to make use of
the second joystick port for the signals (and either a custom driver
or software written to spec would be required, of course).

Topolino is a nice device, but at $40 it costs twice as much as an
Atari mouse!

I am looking for informations about the way Atri C compilers store their debugging informations in executable files.

This is important because I want CENTinel (our 68030/040/060 & 56001/56301 Debugger) to provide Source Level Debugging.

Any informations about Pure C, Lattice C & GCC would REALLY help a lot !!!

And this is what was happenning :) exactly that :)
I was using the first example. Then upon the advice from someone here
I change to the other, and it fixed it :)
Many thanks :)

Hello everyone,

I'm currently writing a game in STOS BASIC. I've made a title screen and have letters i.e sprites fall down the title screen into their positons. The problem I'm having is when the letters fall their backgroung color overwrites where the have fallen to. I only want the characters to be displayed and not the backround color on which they were displayed. Any ideas?

I've no idea. I've been using v2 for about 2 years, and used v1.? for a
few years before that. I haven't seen much in the way of updates, but then
again, I haven't really been on the lookout for them.

> Back in the old days it took about the same amount of time to avoid Sozobon
> C's internal bugs that it took to troubleshoot your own ones ;)

Would you care to tell me what these bugs are/were, as I've not noticed any.
And as the programs I write in C are compiled with Sozobon, I'd like to know
if there are likely to be any problems.

One good thing about Sozobon is the source for the libraries are available,
if you're using dlibs, so any real problems can be sorted out by rewriting
and recompiling the relavent functions. I did that to add desk accessory
support directly into the init code, with a variable to check the PRG/ACC
status, as well as adding support for atexit().

: {
:  int part_num;
:  int price;
:  int quantity;
: }
: i know how to do basic maniputlations of binary trees, like transversing trees
: and all, but i am not sure of how to store a struct in a binary tree.
```

In fact, binary trees are rather easy. You should smth like :

```
typedef struct {
    int partnumber;
    int price;
    int quantity;
    } PartInfo;
```

and then :

```
typedef struct Node {
    PartInfo data;
```

```
    struct Node *left;
    struct Node *right;
    } PartNode;
```

Then, you can access your fields through :

```
{
 PartNode *p;

 /* ...SOME CODE... */

 p->data.quantity = 100;

 /* ...SOME CODE... */
}
```

Now remains the question how your Binary tree will be ordered. Does it have to be sorted by price, quantity or partnumber ? There's no use in this case to use a binary tree if it isn't for searching (hence, a Binary Search Tree).

If you have any further questions, just ask.

Good luck !

MEGA 2 is now added to my site, Still working on the other links so please bare with me. Or you can get MEGA 2 by clicking on the links near the end of the message.

If you have seen MEGA why have you not supported this new zine. There are lots of you out there who must of liked something in it. But you don't tell us what you liked and what you didn't. There are a lot of people who have not yet seen MEGA so get downloading there or over 200 articles on the 2 discs with a nice shall which anyone can use without any info at all on it.

There are many sections in this zine, Some or 1 off and are very interesting to read, It would be impossible to list them all so heres a quick rundown. True horror/ghost tales, STOS, Tesla, Electronics, jokes and humour, Dreams what they mean and stuff, get rich, UFO articles, stories, Anti car crime, Reviews, Returned questionnaires, Science, Black holes, and much more. Simply take a look and you will be amazed on what we have found for you. There should be something for everyone in issue 2. Lets here what YOU would like to see appear !!

It only takes a moment to return the questionnaire, or to offer some ideas of your own. We need your support NOW. The more support we get the faster MEGA will be produced. Anything you do will be included in issue 3 which is currently been done by the MEGA team.

I want to make MEGA "YOUR" zine, so tell me what you want and we will include that page in the next issue. Any ideas not matter who obscure or small they be, are more than welcome.

Can you suggest a good articles site, Something you may think could be of interest to other MEGA readers ? No matter what it is we would like to here from you. Just look at the area of topics we are covering, You name it, we will do it. Anything you may think could possibly help please mail me the links, If I use the site I will give you credit (of course) for giving me the site URL.

The MEGA member list is getting slowly longer but we need more feedback, We need to know that people are reading it and liking it, There would be little point in producing a zine if there is now one reading it. This would be a great shame as there is now other zine like it.

Why not send in something in, Ramble on about anything you like, We want to hear from you. Get your name added to the credits list at the same time. Get on the MEGA mailing list, or ask if you are already on it just to make sure (I may have missed you off for some silly reason).

I have mailed MEGA 1 and 2 to god knows how many people over the last month, Well, Ok, It has not appeared on my site yet, But you can get it now if you wish. Simply join the mailing list and you will get MEGA before it goes onto my site. Out of all those people how now have got it, only a handful have had any comments. This is good but we need more now !

Everyone who has sent me mail over the last few weeks has not been added to the list. If you would like to be added to the mailing list then please re-mail me so I can add you to the list. Please check if you have requested to be added to make sure you have been added.

Issue 3 WILL appear but how soon all depends on you. So get writing and send something in, or at least tell us what you though about MEGA. It only takes a moment so why not go for it, your not going to loose anything by sending a mail to me.

Issue 3 is really taking off now, We need your suppot now ! We have had good responce for MEGA but no one knows how they can help, First of all fill in the questionnaire. I will try to suggest a article that you can write about, you then simply write it and have the sortcut to fame in issue 3.

If you have seen UFOST by Lee Round then please support his UFO zine with you UFO related material. Lee is now in 2 minds weather or not to do issue 3 because of all of you how seam to be scared or writing a letter to him. If you would like to send Lee mail, Send it to me but put "FOR LEE ROUND" in the subject box and I will be happy to pass it onto him. If your interested in UFO's or related stuff then request issue 2 of UFOST now, I regret it still has not been added to my site. Send me a mail if you would like a copy.

I have issue 2 ready for E-mail should you dare to ask for it. Sorry but it has not yet been added to my site, Keep trying though !!

Here are the URL's for MEGA Disczine issue 2.

ftp://ftp.funet.fi/pub/atari/mag/mega/mega2_d1.zip

ftp://ftp.funet.fi/pub/atari/mag/mega/mega2_d2.zip

Thanks to Deano for the upload of issue 2.

Sounds like you don't have the SCSI cable terminated properly. Only the last device should be terminated, either on the device itself or you can place a SCSI Terminator at the end of the cable.

OR

Both devices have the same SCSI ID. Make sure each device has a unique SCSI ID and don't use 7, it is reserved for the SCSI Controller.

Hello all,
My name is Sam and I'm the one who sent out the CDRom Problems message a few
days ago. Thanks to everyone who responded with ideas and suggestions.
Unfortunately, I haven't been able to try any of the suggestions because my
Falcon won't even boot now! :(When I turn on my Falcon, you can here the
power supply kick on and the hard drive starts to boot, then it stops. When I
disconnect the hard drive and attempt to boot from floppy, the only thing that
comes on is the power supply. Can anyone tell me what to do so that I can at
least get my Falcon to boot?
Getting desparate,
Sam

Have you come up with this your self (ctrl space), or is this mentioned somewhere for which shortcuts to use?

Honestly, it runs along at a nice pace! Keep in mind, I;ve used high-end Power Macs, Suns, Pentium IIs and while it can't compare to those systems, it runs nicely. Especially for simple tasks like Microsoft Office. I do have 28 megs of RAM but even under 16 it wasn't bad.

>   The major linux vendors distribute it (like Redhat or Caldera)
>   and you can find it in places like *linuxmall*. For games that

I have seen Redhat at Electronics Boutique. The problem I might have with Linux is that I only have a 500 meg hard drive.... Are these commercial versions easy-to setup as, say, other major OSes? Like a nice setup program?

>
>   There's also a 'freeware' ST emulator called STonX that

I have heard good things about it. Does it allow different resolutions other than the three standard ST ones?

If by trimming and tuning I have to wade through tons of configuration files, I am not sure I want to. Are many packages for Linux "complete" or do you have to compile most packages yourself? Sorry I am so clueless on Unix.

>

The registry is fairly easy to configure, IMHO. Also, for some odd reason (I know I am in the minority), Plug-n-Play has worked flawlessly for me. Windows detected all of my components and I had no conflicts. Strange ;-)

Thanks for all the responses and help!

Run 'nicely' is not something I would describe of
any version of Windows. They're far too bloated
for too little actual functionality. Until I switched
to Linux, I was constantly contemplating an ST
emulator so that I could run more efficient (yet
useful) applications.

That fixation is gone. (although STonX is still
kinda nifty)

Yup. Hardware configuration is more Win 3.1ish. There is
some plug-n-pray but that's primarily with PCI devices.
Whether or not this is a good thing tends to correlate
to one's Win95 experiences (good or bad). For LInux,
500 may be a bit tight. I would expect it to be tight
for Win95 as well. If you dont have any intention of
using the linux dev tools are some of the more hardcore
unix utilities (like tex) you should be fine.

Yes, but it only runs in 256 color mode.

Yes, there is configuration overhead. Unix is a system
where you boss around the OS, instead of vice-versa.

Win95 did detect my 2nd CDROM drive, my tape drive & still
doesn't have a proper driver for it, didn't have a useful
monitor type for my monitor & misconfigured my ethernet
card disabling my modem in the process. Yes YMMV.

The registry is too prone to corruption & not a help to me
as I would be directly modifying it anyways to bend the
machine to suit me.

Am I correct in assuming that you want to assemble 'normal' mnemonics
under GAS? If so, there is a program for such conversions in the MiNT
source distribution (it's probably available on its own somewhere as well).

The GAS m68k assembly syntax is not the new Motorola syntax, by the way.
I don't know why anyone would have wanted to invent something different
for GAS (especially since it also supports something that looks much more
like the 'standard', if you compile it with the right settings), but IIRC
it's usually called MIT syntax.

The new Motorola syntax is

```
  move.w  14(a0),d2     ->    move.w   (14,a0),d2
  move.b  d0,temp       ->    move.b   d0,(temp).l
```

and so on.
Does anyone happen to know of an Atari assembler that handles the code to the right above, by the way?

>What is the meaning of things such as 'moveml a6@,#0x43c' or 'jra >0x16584'?

The '@' is the GAS way of doing indirect addressing.
GCC does not create normal register lists for MOVEM for some reason, but rather gives the extension word (with a bit for each register) directly (GAS can handle register lists just fine).
Hexadecimal numbers are given with '0x', like in C, instead of the usual '$'.
IIRC, GAS handles all the usual branch mnemonics, but it also has a couple of extra ones that are used by GCC for some reason.

>What is the new interpretation of the 'old' mnmonics 'movem.l' of 'addx.l'?

I think (normal) GAS will throw an error for those, or possibly interpret them as labels.

Are there any TOS calls (GEMDOS/BIOS/XBIOS) that obliterate any of their stacked parameters?

Given a TOS call of the form:

```
     pea  address
     move.l   #datum,-(sp)
     move.w   #funcnum,-(sp)
     trap #X
```

can I rely on the stacked funcnum and address remaining untouched?

(I am thinking of a code optimisation whereby a number of similar OS calls in a row can use the already stacked parameters and just alter the function number [or vice-versa: keeping the func num the same but altering the stacked parameter] before issuing the next trap call to the OS)

So the above example may be followed by:

```
     add.l    #itemsize,2+4(sp)
     trap #X
```

without having to :

```
     pea  address+itemsize
     move.l   #datum,-(sp)
     move.w   #funcnum,-(sp)
     trap #X
```

(ie: datum and funcnum remain the same)

It seems OK on my TOS 3.05 TT, but, as I no longer own any other Atari 68k system, I am unable to test my ideas out

--

All email sent to my inca address will fail, however I can now be contacted via an intermediary : gem at tos pl net. I would like to apologise to the genuine respondents that this may inconvenience.

I haven't personally installed Redhat before, but I've heard it's a good
installation. 500 meg should be plenty (I used to use Slackware and
XFree86 on a 500 meg drive and I still had room to spare).

As an end-user I had to reconfigure the kernal to support my hardware,
and if I wanted to connect to the internet, I had to write my own script
to connect to my provider and start the pppd daemon. There are books
that explain this, but they aren't terribly clear. Also configuring
XFree86 (the Xwindows) can be a real pain in the butt. Other than that,
that was about it. :)

Has anyone got information on the LINE-F routines in TOS? I's like to know
what they do in the highest possible detail.
Seems to be undocumented stuff: I can find much documentation on LINE-A, but
not on LINE-F (??).

Thanks, Marco.

LINE-F is used by the FPU, if one is installed. Otherwise, any LINE-F

call will give 11 bombs.

Hi everyone :)

Has anyone thought of porting descent from interplay to the falcon?

after all it runs quite well even on 386 sx machines and only requires 4mb of RAM and to top that it only uses around 128 colours!

The falcon, especially ones with co processors would be easily capable of it

(only just thought of this because i have borrowed a 33mhz 486 (no floppy drive) to play against a friend in death match.

i don't know anything about this sort of programing but it sounds like a good and possibly popular idea

:) Ian Norton

Hi there,

I wonder if anyone know how to change resolutions in the correctway in order to let the OS know about it restart the AES and reload the ACCs?

The thing is that I'm writing a resolutions changer for the Nova cards but I can't get it to work properly. How is it realy ment to be done and when should I do the physical resolution change?

I think I have got a problem as I can only do a immediate resolution change on the Nova, so I have to change resolution before my program exit. The thing is that I think it's the AES which sets the resolution just before it restarts.

I guess this all sounds wacky and it is. :-)

Any ideas anyone? Or does such thing exist for the Nova cards?

Not exactly true. Earlier TOS versions (upto 1.4(?)) (mis-)used LINE-F in
the AES part to squeeze a few bytes out of it. But this was as internal
as you can get, and you won't find any docs about that.

I don't know if that was ever documented, but it should be true for all
TOS versions.

Apart from the Compendium, there should also be some pieces if example code
floating around on the Atari FTP sites somewhere. I might even have a link
to it on my (hugely outdated) Atari Developers page.

: > I am not using C, so the cpx header or lib that could exist won't
: > help directly.

: Well, if you are planning on doing it in GFA, I would give up, 'cause
: I doubt that it is possible. The CPX "init" code passes back a set of
: call-back functions that the control panel will call when certain
: things happen. I am not sure, but I dont think GFA has the concept
: of addresses of functions (appart from embedded asm routines).

Hmm, I seem to recall GFA having a function to call C-style routines...
If so, he should be able to use that...

The GEM-list keyboard standard (more or less agreed to years ago and used
mostly by the Germans but also by others) uses CNTL-D for Diminish a window,
that is, iconify.

There was an Atari standard keyboard short-cut list which hardly any one
adopted. I think the list in TAC and MASS is this one.

However, this list already conflicted with standards emerging from Germany
and so a group of commercial, shareware and PD programmers got together on
the Internet in 1994 to agree on an alternative set of keyboard equivalents
which became known as the GEM-List Keyboard Short-cut Standard.

Table K2: GEM-List Keyboard Equivalents

Key combination	Meaning
[Cntl-I]	Show Info about selected object
Window Manipulation	
[Cntl-Tab]	Cycle windows
[Cntl-W]	Cycle windows
[Shift-Cntl-Tab]	Reverse cycle windows
[Shift-Cntl-W]	Reverse cycle windows
[Cntl-Esc]	Close top window

[Cntl-U]	Close top window
[Shift-Cntl-Tab]	Close all windows
[Shift-Cntl-U]	Close all windows
[Cntl-D]	Diminish window (put in a menu or iconify)
[Cntl-<*>]	Full window
[Cntl-<+>]	Zoom in/larger font
[Cntl-<->]	Zoom out/smaller font
[Cntl-<0>]	Zoom 100%

I/O

[Cntl-O]	Open
[Cntl-N]	New
[Cntl-S]	Save
[Shift-Cntl-S]	Save as...
[Cntl-P]	Print
[Shift-Cntl-P]	Printer configuration
[Shift-Cntl-L]	Page layout
[Cntl-L]	Go to line
[Cntl-Q]	Quit
[Cntl-X]	Cut
[Cntl-C]	Copy
[Shift-Cntl-C]	Append/add (to clipboard)
[Cntl-V]	Paste
[Shift-Cntl-V]	Insert (paste) file

Editing

[Cntl-A]	Select all
[Shift-Cntl-A]	Deselect all
[Cntl-F]	Find
[Cntl-G]	Find next
[Shift-Cntl-G]	Find previous
[Cntl-R]	Replace
[Cntl-T]	Replace next
[Shift-Cntl-T]	Replace previous

[Cntl-Help]	Display help contents
[Shift-Help]	Enable/disable help mode
[Shift-Cntl-Help]	Other help function
[Undo]	Undo last operation
[Cntl-Undo]	Redo last operation
[Shift-Undo]	Revert (abandon all changes and reload)
[Cntl-Backspace]	Delete word to left
[Cntl-Delete]	Delete word to right
[Shift-Cntl-Delete]	Delete to end of line
[Shift-Cntl-Backspace]	Delete from start of line
[Cntl-Y]	Delete line
[Shift-Cntl-Y]	Delete paragraph
[Delete]	Delete selected objects
[Insert]	Toggle insert/overwrite mode
[Cntl-Z]	Font selector
[Shift-Cntl-Z]	Character map (text processor/editor)

Moving

```
    [Cntl->/<]              Move one word right/left
    [Cntl-up/down]          Move to top/bottom of page/frame
    [ClrHome]               Move to top of document
    [Shift-ClrHome]         Move to bottom of document
    [Shift->/<]             Move to end/start of line
    [Shift-up/down]         Scroll one screen up/down

    Blocks
    [Cntl-B]                Set block start
    [Cntl-E]                Set block end
    [Shift-Cntl-B]          Move to block start
    [Shift-Cntl-E]          Move to block end

    Dialog Boxes
    [Return]                OK, Yes, etc...
    [Undo]                  Cancel, Abort, etc...

    <> means numeric keypad
```

The complete list and introductory text is taken from The Atari A-Z.

The CPX "contents" are a usual resource tree as saved by all Resource Construction Sets. Most of those allow saving the tree as C source code which you can use to include the tree into the binary (a must for a CPX).

Upon loading, the CPX binary returns a list of function pointers to the CPX server. For most CPXs, only one pointer is important, which is the one to be called when the CPX is invoked by the user. As a parameter to that function, the CPX gets a pointer passed that points to a structure with all sort of important information, amongst those the info needed to objc_draw() the tree into the window.

> what if I move the control panel? what wm_moved message do I get?

None. The CPX server handles that bit. The CPX only gets a REDRAW message when necessary.

Cheers Peter

> that should be used within RSC-files.

You can use whichever you want, depending on how you want to use that resource tree. Usually your program will want to display it using the AES objc_draw() call, for that you need to use the special image format used by AES. This format is entirely internal to RSCs and has no name.

If you use some other display code that objc_draw(), or if you set the OBJECT.ob_type to G_USERDEF, you can design your own image format or use any existing one.

> Secondly, does
> anyone know of a program that could be used to create
> icons or/and buttons in these formats.?

Most resource construction sets will place images into RSC files only by using the special AES format mentioned above. Images loaded from ICN or IMG files will be converted by those RCS.

It's the OS' task to keep track of x, y, width and heigth for the iconified
windows. IIRC there is a wind_get() call sub-code for inquiring this.

Most people consider this one of the many bugs in AES 4.1. No docs I've
seen mention this as required. So basically this is one of the many work-
arounds we'd need to add to keep the intrepid users of AES 4.1 happy.

A program that allows iconification from a menu but as no ICONIFIER gadget ?
Very confusing, mildly stated ;-) You should adjust the wind_kind parameter
to contain the iconifier too.

Cheers Peter

IIRC, with TOS 1.00 the LINE-F is used internally for GEM AES and VDI calls.
I don't know where it changed to bombs, but with 1.62 it does.

Is there any software emulating a FPU that catches the Line-F calls and acts like a (slow) FPU? I know there is some thing like that for Linux, but for Tos usage?

> as you can get, and you won't find any docs about that.

ST Internals (Abacus) gives a bit of info about it, saying that it contains self-modifying code. The idea was that a single 0xf??? opcode, with bit 0 set, replaced the following code:

```
     tst.l      (a7)+
     movem.l    (a7)+,dx-dy/ax-ay
     unlk       a6
     rts
```

The dx-dy and ax-ay were selected by ANDing the opcode with 0x0ffe, and left shifting 2 bits. By copying this word into the LINE-F code, the movem.l could 'unstack' any of the registers between d3 and d7, and between a0 and a5.

If bit 0 of the opcode was clear, it was taken as an offset in a jump table. The jumptable entries corespond to 0xf000 to 0xf9cc. What each of these did is anyones guess.

Hello everyone,

Tab does anyone know where I can locate a decent movie player for MPEG, AVI, e.t.c. I got one here and am using on a mega/ste with 2 megs of RAM but it very seldom works and usally only in greyscale when it does. I also have a copy of 1st guide, but this displays the movies very pixely. If you stand back from the screen about 7 feet you can sort of pick out the movie :) and greyscale is hopeless in this as well. Anyhow if anyone has any ideas on where to locate a player/multi-media program, please let me know.

As well, what kind of RAM fits thte MEGA/STE. I really don't want to open it and look at the sockets to determine. Can simms fit it?

Scott.

Try browsing through the ICTARI disks at
http://www.elis.demon.co.uk/ictari/issues.htm

You'll find stuff in GfA Basic for the VA protocol (and more) on number 39 and 41
PS. if you are a programmer who likes to share his work with others, please also think about uploading some stuff to e-mail: augeas@elis.demon.co.uk

Hope you find what you're looking for,

Theo Ros (theo.ros@rnw.nl)

Hi all

I was looking around for DMA (music) libraries for GFA basic, does
anyone know where to find them?

Only if you help us out !

I am currently working on issue 3, We have had some new members to support the new zine but I am sure there are a lot of you out there how would like to write somthing.

If you would but dont know how, then write a articles for the WIBBLE section of MEGA. Simply keep typing the first things that come into your head for a line or 100, and mail it to me.

Have any ideas on stuff to include, I like to hear from you.

Sorry to all those people who are waiting for MEGA to appear on my site, It should be there shortly. I will mail it to people who request it.

If you have already got MEGA, Make sure you have got the disc_1a.zip and disc_2a.zip files, The ones without the "a" are a faulty version. This was mailed in a almighty cock up on my part. The main problems are bottoms of files missing, a few not on the disc and the music will not turn on if you turn it off.

Anyone who I sent my questionnaire to , all have now been removed from the mailing list as they have not given permission for me to keep them on recored.

Please take a few moment to send your support to MEGA, I know there are a lot of readers out there, so Keep the mag going and offer your help. Support you ATARI computer, don't hide behind your keyboard, let the world hear you !!

ATARI FOREVER

I can't imagine when I'd have time to start messing around with
Fido or NeST, but I've no problem with anyone else having a go.
-It'd be nice to include a note saying where you got the issues
from, and what ICTARI is meant to be about. The issues I upload
eventually end up as ST-Club disks, which I'm happy about.

Issue 48 is now fixed, by the way...

Have Fun,
"Augeas"

Like Ben said Aniplay works very well as does M_Player. Remember you
only have 16 colors however.

Your STE will accept standard 30 pin simms, 8 or 9 chip. Even 100ns
would work, I guess to a point, the faster the better. If you already
have two megs, you just need two more simms.

Mike

: Is there any software emulating a FPU that catches the Line-F calls and acts
like
: a (slow) FPU? I know there is some thing like that for Linux, but for Tos
usage?

Linux 68k currently uses some code from FreeBSD, thoughit's not in the
official source distribution because the BSD liscense and the GNU liscense
are not 100% compatible. My guess is that with some modifications for the
lowlevel stuff the FreeBSD could be adapted for TOS as well, although most
TOS programs don't rely on an FPU...
The code used in Linux/BSD can be found in the Linux 68k FPU-emulation code
patch on the NoCrew FTP site.

Thanks all for your help on this subject.
It has made me find my bug, which was not decrementing the Program counter by 2 before creating the stack frame.
Result: instead of analyzing the Line-F code, an arbitray other value was being analyzed...

Marco

GFA has some inbuilt commands for this. If I remember correctly they are DMASOUND, MWOUT, STE?, TT? or something like that. I can give you a more detailed description if you like.

Regards

No, but there must be one. It is certainly trivial to do on an ST(e)
with Setscrn(), Getrez() and a Degas image.

>and play a sound on boot for a falcon 030?

Sorry, I've never done a thing with sound!

>if possible same

Yes but it probably would be a little more involved.

It's an obvious bug in my opinion Anthony. Imagine this ... there you
are with an iconification message, you close the window then horror of
horrors the window will not open again! Same problem in reverse.

Yes, it wouldn't surprise me if it did. Saving PREV somewhere
immediately after iconification would be a wise precaution.

>And I guess you work with Magic (and again IIRC, from my tests, I couldn't

I don't know. Iconification is a mess so I keep it simple. I use
wind_set(WF_ICONIFY,msg[...]) when I get the iconification message and
wind_set(WF_UNICONIFY,msg[...]) when its counterpart is received.

>So it's better to
>save the position before iconifying it like Anthony said.

He's most likely right. I didn't think of it as I whipped up my
example! Iconification should never have been left to the programmer
in the first place - it is a system function and the only part the
programmer should play in it is to have the ability to ignore the
original iconification message. I'm not even sure if the uniconify
message ahould even be "visible". Depends on the implementation.
Anyway, we're stuck with it as it is. ;-|

I'm not sure. In some docs somewhere I have seen mention of a save
area for either BIOS or XBIOS calls. What the implications of this
are, however, is another matter.

Can anybody else shed light on this?

Hi,

I wonder if anyone else using Lattice C has got this problem.

If I compile a program and then set the load program into
Fast-RAM flag, my program takes up twice as much memory!

Has anyone noticed this????

Am I the only one with this problem?

Am I the only one who has got Fast-RAM and wants to use it?

Anyone???

Perhaps you could try a different emulator - Pacifist perhaps? I
haven't heard of any problems with using Lattice C or PureC with
MagicPC - well no more than with standard MagiC anyway. Mark Williams
C (which is command line based) certainly works with the demo, so I
would expect Sozobon and GNU would also.

I've been having problems posting this ... if you've
seen it twice already, please accept my apologies!
!@#$%^&* Free Agent, someday I'll get my Falcon on-line!

For quite awhile now, Wizztronics
(http://www.wizztronics.com) has been asking
for comments and requests about what we would like
to see in their forthcoming TOS/GEM clone computer.

I've sent in a bunch of email suggestions, and recently
asked when the promised survey would be posted to their
web page. Part of the reply from Steve Cohen read:

>> After reading Email, almost daily I find many users
>> come up with brilliant suggestions. I'm sorry we do
>> not reply to each message sent, it would simply
>> take too much time away from developement.

I asked him if it would be okay to publish this comment
to the Usenet, and he said:

>Yes I have no objections to your request. We want
>users and prospective users to know what's going
>on. We do not want people to think we forgot
>about, or that we do not read their mail. All
>responses received from customers, and users of
>the TOS platform are important to us.

Now is the time to get that suggestion in writing and
emailed off to toscompinfo@wizztronics.com !! You
don't have to be a computer scientist to make a
suggestion, either -- if you've ever said to yourself
"I wish my computer would..." or "I wish I could do
this with my machine...", write it down and send it in!

On other computer platforms, you only get what they
have to offer. On our platform, you get a chance to
directly influence the features and capability of the
next update to the operating system & hardware.

Now's your chance!

I've got Sozobon C running in Windows 95 as a Win32 command
prompt. You can use it to create an Atari ST executable. I'm hacking
with it in my spare time and may add onto it as time goes by.
You can find information on it at:

http://www.geocities.com/SiliconValley/Peaks/3562/

I was playing around with the source code (Pure C) that was included
with my ScreenEye video digitizer and Lattice C. I didn't have much
luck working with it, mostly because I don't know what I am doing, and
also I think that some of the lib's required for the program to be
compiled are from the Pure C package. I had asked Remi Vanel (author of
Mountain) about this as Mountain works well on the NOVA as does

M_Player.
He gave me an assembly example below, but I am even worse at that:).
He is also very busy with studies, so I hate to bother him to much.

>Is there anyway to report the video mode to the ScreenEye software so
>it will display properly on the NOVA video card?

>Argg, *very* difficult if you don't have the source code.
>In the code, when a dot is drawn you juste have to replace :

```
>move.w (a0)+,(a1)+
```

>by:

```
>    move.w   (a0)+,d5
>    ror.l        #5,d5
>    lsr      #1,d5
>    rol.l        #5,d5
>    ror      #8,d5
>    move.w   d5,(a1)+
```

>where d5 is an unused register.

>As there is more instructions in the second methode, it will be too hard (for me)
>to patch directly the executable.

>Maybe you can ask the author... ?

(No! Software looks to be the author of at least some of the package.
Matrix the rest).

I have what I think is the complete source and other related files
needed to compile this under Pure C.

If anyone thinks they might be able to help out, it would be worth an
HBS T-36 for their ST/MST if I was able to get the software up and
running on my Falcon/NOVA setup.

Thanks,

Mike

Do you want a "module" player or a "midi" file player? If you
are after a midifile player which cam play sounds as well
there is only one and it's multitasking friendly. It works
very well under MagiC. This is called MIDPLAY and you can
find out more about it here:

http://perso.wanadoo.fr/softjee/

If you want a midi file player without sound you can find one
there as well, it's called PRETTY.

If you want a module player I don't know as I have got none
which works properly. There were one called MEGAPLAYER which was
pretty good and could play most formats, but it doesn't work
on my computer at all.

I noticed after looking at the Atari mouse port pinout in my TT030 user's manual that on pin 5 there is room for a third (middle) mouse button.

While I don't know of any software that makes use of the third button, I wonder if the facility is there for a third button on pin 5, or is pin 5 simply not connected or ignored by the keyboard? If pin 5 is not ignored by the keyboard, does TOS support the third button? Is there any GEM software that uses the middle mouse button?

I ask as I am working on an adaptor to allow a serial mouse to be connected to the Atari ST mouse port. I would like to make the third button do something useful, but if pin 5 is disconnected or ignored it would not be sensible for me to use it. The other option is to make the third button act as a double click or as a simultanious left and right click, but I would not want to exclude users of perhaps X Windows or something that does make use of the third button on pin 5.

Another question - I observe that when the mouse is moved too quickly on my TT the mouse cursor moves in the reverse direction for a moment. I have noticed the same behaviour on other Atari ST series machines. (The effect is more noticable with third-party mice as they are faster than the Atari mouse.) I guessed that this must be caused by a movement count in the keyboard processor overflowing when the mouse is moved too quickly, and causing the sign to change. Is this really the reason? Is there anything I can do about that?

And finally, would there be any interest in such an adaptor? There is a serial mouse driver available allowing a serial mouse to be used on a serial port, but then you have the mouse port doing nothing while on the ST, with only one serial port, you have no serial ports left. Wouldn't it be better to be able to connect a serial mouse to the mouse port, leaving your serial port free for a modem? What do you think?

I look forward to your comments.

The TRAP dispatcher uses a fixed memory location to save
the registers and return adresses. The pointer to this
area is savptr (0x4A2). This says also nothing about
the routines changing their parameters on the stack.
I wouldn't count on those parameters staying unaltered.

Hans

I beleive that FaST Club sells a Mouse Tricks program that allows you to
use the third button on a mouse. all sorts of other tricks also.

bloody right it is a marvellous idea. Amiga mice are getting hard to
find,
Atari mice even harder. a thingy that would allow you to use a serial
mouse
on an ST mouse port is _such_ a good idea! I think I speak for all
owners
of the excellent Atari (sic) mouse that this would revolutionize usage.
I mean, if you can get a standard PC mouse hooked up, then wouldn't
other
possibilities such as track balls (maybe even tablets??) also work?
plus the added factor of not having to constantly unplug and plug in the
ST mouse connector might be an option as well, non?
YES!

IMHO Atari ST (at least) does not have hardware provisions for 3-button mouse.
This "extra" pin is simply empty.

     Bonjour,

Dans l'article <3566833d.13867428@news.zetnet.co.uk>,
Tony Greenwood, <paxton@zetnet.co.uk> a ©crit :

©©>IMHO Atari ST (at least) does not have hardware provisions for 3-button mouse.
©©>This "extra" pin is simply empty.
©©
©©I believe the ATARI has 4 Mouse settings..well mine does...
©©
©©1=left mouse button
©©2=right mouse button
©©3=both mouse buttons
©©4=nothing (deep man!)
©©
©©Detecting third mouse button simply replaces option 3...I think!!

     Not with standard functions... It seems that GEM/VDI functions

theoretically allow one button per bit of the returned word for the mouse-buttons state.

That is, if 3 buttons :

%000 -> no button pressed
%001 -> button 1 pressed
%010 -> button 2 pressed (makes 2)
%011 -> button 1 & 2 pressed (makes 3)
%100 -> button 3 pressed (makes 4)
and so on...

The matter is that it seems that mouse-controller doesn't seem to be made for using these capacities...

I had an optical 3-buttons mouse. As far as I could remember, pressing the middle button had no effect on 520 but was recognized on Mega STE. But the returned word was incorrectly set.

It was a long time ago, I can't give more details...

There's one that simply plays over the MIDI port. It's called SMF and should be available at most Atari FTP sites in the MIDI/Music area.

Hi!

I'd like to know if there's an implemnation of strcmp() and strcasecmp() out there which respects foreign characters correctly, so that sorting via those functions does "the right thing". I could do this for the German "umlauts", but not for all the Scandinavian, French and Spanish national characters. So, is there anybody who has done that?

Alternatively, could people from one of the above mentioned countries post (or mail) a list of their national characters and how they get sorted in the alphabet, with and without attention to upper/lower case?

Ciao

Thomas

P.S.: I need that for Thing, as some people have sent requests for correct sorting ...

Hi there!

Mikael Folkesson (mikaelf@triton.tripnet.se) asked me to post this
message in the newsgroup:

Ruffly translated shortcuts (from German): (These ones are the real
standarised ones. Control-Space is no standardised shortcut!)

Standardised after decision of the developerconference (August '89):

Keyboard shortcut	Function
Control-C	copy
Control-F	find
Control-O	open
Control-Q	quit
Control-V	paste
Control-X	cut

Shift-"arrow up"	one page back
Shift-"arrow down"	one page ahead
Shift-"arrow left"	Cursor to beginning of line
Shift-"arrow right"	Cursor to end of line
Control-"arrow left"	cursor one word back
Control-"arrow right"	cursor one word ahead
Home	to beginning of document
Shift-Home (Clr)	to end of document

Not standardised, but de facto-standard:

Keyboard shortcut	Function
Control-A	select all
Control-G	search next
Control-M	save as...
Control-N	new document
Control-P	print
Control-S	save
Control-R	replace
Control-U	close top window
Control-W	cycle to next window
Control-Y	cut line to clipboard
Control-Z	start shell
Alt-Control-Space	iconify top window
Shift-Alt-Control-Space	iconify application

NB: All 'Alternate-Control'-keyboard shortcuts are reserved for the system.

WinSton is not a very good emulator on the PC. Its really meant for running games, but doesn't even do this as well as PacifiST.

Have you tried TOSBOX? Thats probably the stablest emulator around, and its designed to run serious software.

Failing that, (and spending money) get MagicPC.

Cheers!

Hmm.... on the other hand I do have got a AB040 so my computer is
pretty fast. What is your problem? Atleast on my AB040 there are
no problems at all, but I guess a slow Falcon might have some
problems as it's quite a demanding program and I have heard that
under a multitasking system it can cause some keyboard troubles.
BTW. You realy should see MIDPLAY on a 040. The load is almost none
existant. It hardly show at all! If I turn off the caches the computer
hit the roof but with the caches enabled (which are bigger on the
040 than on the 030 as well) I get no slowdown what so ever. It's
marvelous what caches can do for you. :-)))

It seems that X11 can use the third button as I saw a friend using this
button on a falcon under Linux.

But he has a Mega-STE keyboard and not the original Falcon keyboard.
Perhaps these keyboards (and the TT-Keyboards) are quite different from
others.

Regards,

Benoit

The Atari SVR4 Unix for the TT and Linux support the third mouse button.

Yes it'me, and effectively the third button work as a real third button with my
MegaSTE keyboard whereas, before, it doesn't work with the original one. So i
think
TT & MSTE keyboard are able to recognise 3 buttons mouse. I will take time to look
on TT keyboard datasheet this evening to confirm this information and eventualy
i'll
try to disassemble the 6301 code to check the existance of the third button
routine.

Hey all,

I remember reading some time back about how the DSP in the Falcon would be able to emulate a modem. I know the MWave card in my PC does this and

I was wondering if anyone ever wrote one for the Falcon?

(This was going to be a quick note ... sorry it
ran so long. Just excitable, I guess.)

> I'm still amazed that something like this
> hasn't been mentioned here before though...

Well, they're busy working on the new machine, and
I'm trying not to drool excitedly in public. Plus,
I'm not really associated with the project, so it's
hard to know just how much I should say.

I do know (via email) that the promised survey on the
Wizztronics page will be posted Sometime In May, which
is why I'm suggesting that the deadline for ideas and
suggestions is drawing near.

Since I consider myself a "recreational programmer"
(I know enough to get by, but not enough to create a
sale-able program), I'm doing two things:

1/ Sending in suggestions to make recreational

programming easier, both from a hardware
standpoint and from a GEM/AES standpoint
(since ease of use AND ease of programming
causes system growth and acceptance), and
2/ Advising the experts I come across that their
input is needed, right now!

The 680x0 architecture is already MUCH more efficient than the x86 architecture, and GEM ... for those who choose to use it ... is already MUCH more efficient than MS-Windows; so concentrating on ease of use and ease of program development is an important consideration at this time!

Since Microsoft's[s&m] house-of-cards[tm] seems to be nearing it's critical height, the availability of another stable, reliable operating system (TOS) and operating environment (GEM, MAGIC, et. al.) gives us an edge we haven't had in years. There's a slight chance we could overcome the dominant industry system, in much the same way Microsoft overwhelmed the prior dominant industry system (CP/M).

You may think your idea is "so obvious" that they can't help but implement it, but my passing reference to an "evnt_joypad()" call resulted in several postings and an email or two that said "How come they haven't done that yet?"

Just to be on the safe side, SUGGEST THE OBVIOUS!

In addition, Steve Cohen has stated for public consumption that he receives email suggestions daily, and that many of the ones he reads are "...brilliant!"

Just to be on the safe side, SUGGEST THE OBVIOUS!

Thanks for letting me ramble.

Hi!

It works indeed!

I have a TT keyboard on my Medusa and shortly bought an Alfa data 3-button mouse for Amiga. I had to switch 2 little jumpers and now it works...

Linux supports the middle button. Before that I had to set Emulate3Buttons in the XF86Config and press both buttons together without shifting the mouse. But that was messy.

If you have a 'normal' ST keyboard you can just connect the UP line of the Joysick 2 port also to pin 5 of the mouse port. That's it!

Hi!

Andreas Schwab <schwab@issan.informatik.uni-dortmund.de> wrote:
: Check out strcoll and strxfrm.

Well, that doesn't help me much for the MiNT-Lib:

```
/* dummy implementations for strcoll and strxfrm, that doesn't know about
 *    locales */
```

(That's a quote from strcoll.c ...)

So, my question remains: Has anybody an implementation of a local character aware str(case)cmp() for the Atari's charset?

And just an implementation of strcoll() or strxfrm() also won't be enough,

because as far as I've understood them, they don't provide case
insensitivity. I'd also need a locale aware implemenation of toupper()
(or alternatively of tolower()), which the MiNT-Lib doesn't provide,
either ...

Ciao

Thomas

P.S.: That refers to PL46 of the MiNT-Lib

Hey everyone,

I've got a poll set up where you can vote for the BEST Atari system.
Please stop by and place your vote! Right now the Lynx is in the lead
with the 2600 is 2nd place and the Jaguar in 3rd. Of course, I'd really
like to see the ST and 8-bit have a presence too...

Here's the votin' place:

what?
It seems to me that it is _during_ the survey that one makes
suggestions. Unless this survey is a compilation of info,
rather than requesting info? The Wizz page seems to suggest to me
that the survey form will be posted and one can input then, non?

IIRC, the reason they added the toscompinfo@wizztronics.com
email address was to handle the suggestions they were receiving.

> Unless this survey is a compilation of info,
>rather than requesting info? The Wizz page seems to suggest to me
>that the survey form will be posted and one can input then, non?

Yes, the Wizz page /does/ make that implication. If it
wasn't for the fact that I'd received an email from
Wizztronics noting the receipt of many good ideas
from a variety of Atarians daily and stressing the fact
they can't reply to every suggestion received, I'd be
inclined to wait, too.

I'm looking forward to the survey, sensing it will be
a "which do you prefer, this or that" type of document
(just guessing, here).

-- George Crissman
-- strads@tmisnet.com

Wouldn't it be nice to have a form_progress(), an

easy-to-use standardized progress bar similar in
concept to form_alert? It could be non-modal so
that several could be active at the same time. This
would be perfect for multitasking environments or
multiple-simultaneous-file-downloads when using PPP.

Subject: Middle mouse button, how reported?
Date: 1998/05/02
Message-ID: <7CGXCEZ@tos.pl.net>#1/1
X-Deja-AN: 349525032
Organization: Tariland Computer Club
Newsgroups: comp.sys.atari.programmer,comp.sys.atari.st.tech

How is the middle mouse button state reported by the keyboard processor?
According to the compendium a relative mouse packet header byte reads as
follows:

0xF8 - No buttons pressed
0xF9 - Left button pressed
0xFA - Right button pressed
0xFB - Both buttons pressed

How is the middle button reported?

And can anyone tell me on which machines the middle button works and on
which it doesn't? I think someone mentioned before that it works on the
Mega STE but not the ST. What about the TT, Falcon, STacy, Mega ST or any
other machines? What about the new Atari clones, do they even have an

Atari mouse port?

Thank you for your assistance.

I know very little (if not nothing!) about this, but I would think
that you ought to be investigating 'wide' character sets to see if
they have a portable scheme for this problem.

>out there which respects foreign characters correctly, so that sorting via
>those functions does "the right thing". I could do this for the German
>"umlauts", but not for all the Scandinavian, French and Spanish national
>characters.

Is this simply because you don't know which are upper/lowercase ir
because the order they appear in different fonts changes (or both)?

>So, is there anybody who has done that?

Certainly not me! :-(

Gem is theoretically capable of dealing with lots of buttons.

>something that does make use of the third button on pin 5.

iirc, 8 bits are used so 8 buttons could be used. In reality though, this would be unrealistic as only 7 buttons could be used because of software constraints. Having said that, for the same reasons, I wouldn't expect software to "see" more than two buttons.

>Another question - I observe that when the mouse is moved too quickly on
>my TT the mouse cursor moves in the reverse direction for a moment. I have

>can do about that?

The keyboard processor reports mouse movement as keyboard "make" and "break" actions. If it reports it faster than the serial line or interrupt service routine can cope with then things are going to go "pear shaped".

>And finally, would there be any interest in such an adaptor? There is a

>be better to be able to connect a serial mouse to the mouse port, leaving
>your serial port free for a modem? What do you think?

It would indeed be better to have it conected to the normal mouse port, certainly for folks who are "online".

```
> FOR i&=1 to LEN(the.string$)
>   MID$(the.string$,i&,1)=CHR$(PEEK(table%+ASC(MID$(the.string$,i&,1))))
> NEXT i&
```

(I can't tell which version of BASIC you are using, so some of these suggestions may not yield any improvement in code size or speed)

First optimisation: calculate the string length _before_ entering the loop. Depending on how good your BASIC is, it may already do this. But, it doesn't have to. So, the code becomes:

```
  length = len( the.string$ )
  For i = 1 to length
    do stuff
  Next i
```

Second optimisation: You've calculated the same address twice as part of two MID$ statements. Calculate it once, and use the calculated result later.

```
     address = adr( mid$( the.string$, i, 1 ) )
     bytepoke address, bytepeek( adr( table + bytepeek( address ) ) )
```

Third optimisation: move the address calculation out of the loop - you only need to find the start of the.string$, and you'll be stepping through it byte by byte, so there is no need to recalculate the address on every iteration.

So, it becomes:

```
  address = adr( the.string )
  length = len( the.string )
  for i = 1 to length
    address = address + 1
    bytepoke address, bytepeek( adr( table + bytepeek( address ) ) )
  next i
```

I haven't coded seriously in basic in about a decade, so these suggestions
on code optimisations may not be worth the effort of changing your code.

Hisoft BASIC, I think (its the &'s that give it away).

> So, it becomes:
>

... but I think it is highly likely that they are worth changing, as (IMO) it is unlikely that it is automatically making these optimisations.

Is there a way to read/write data from/to a harddisk
during an end of sound buffer interrupt routine?
(on a FALCON)

I tried several functions: rwabs, dmaread and Fread,
but the all freeze the system so that even a ctrl+alt+del
does not work.
This is probably because these are BIOS, XBIOS AND GEMDOS functions.

Does anyone know of a way that does work, or is what
I want imposible?

For those of you who have not seen the best disczine around send a E-mail to me and request issue 1 or 2.

If you have seen MEGA why have you not supported this new zine. There are lots of you out there who must of liked something in it. But you don't tell us what you liked and what you didn't.

It only takes a moment to return the questionnaire, or to offer some ideas of your own. We need your support NOW. The more support we get the faster MEGA will be produced.

The MEGA member list is getting slowly longer but we need more feedback, We need to know that people are reading it and liking it, There would be little point in producing a zine if there is now one reading it.

So come on, Lets have some feedback, I want to make it YOUR zine, Let us know what your would like to see happen and the MEGA team will support your idea.

Why not send in something in, Ramble on about anything you like, We want to hear from you. Get your name added to the credits list at the same time.

I have mailed MEGA 1 and 2 to god knows how many people over the last month, Well, Ok, It has not appeared on my site yet, But you can get it now if you wish. Simply join the mailing list and you will get MEGA before it goes onto my site. Out of all those people how now have got it, only a handful have had any comments. This is good but we need more now !

Issue 3 WILL appear but how soon all depends on you. So get writing and send something in, or at least tell us what you though about MEGA. It only takes a moment so why not go for it, your not going to loose anything by sending a mail to me.

If you have seen UFOST by Lee Round then please support his UFO zine with

you UFO related material. Lee is now in 2 minds weather or not to do issue 3 because of all of you how seam to be scared or writing a letter to him.

Hi!

Anybody here got some regular expression matching and substituting going with pure c? Is there a library available to do this stuff? I know that GCC can handle it, but is there a way to stick to pure c?

Thanx!
Gilles

What about something like:

```
#define GFX_MODULE   0x01;
#define DTP_MODULE   0x02;
#define TXT_MODULE   0x04;
#define.....

void main()
{
 while(do_program(GFX_MODULE|DTP_MODULE|TXT_MODULE));
}
```

Which will give you a program with those modules? Cool eh?

:-)

Port de GNU C library to Pure C. I might have
it lying around somewhere. Will have a look for
you if you are intrested (I also have the complete
string lib).

Can anyone help me with a piece of C code that can do DMA play on 44k1?

I can get DMA play to work on falcon sample rates, so I know how to get
DMA play to work, but not with an external (44k1) clock signal and it's
really the external clock part I'm looking for (my guess it's about one
line of code...)

Purpose is a fast'n'simple player to scan samples (avr, wav and aif) on
cd-roms without having to start (and close!) an application.

btw I tried several pieces of source that claim to use the external
clock I found on the internet but none produces any audible results.

Is it really a question of the software seeing the physical buttons?
I would have thought it would be possible through the OS to have a
button
press assigned to whatever event you want? i.e. clicking the third
button
send a signal to the closer of the window the cursor happens to be
topping then.
or the third button could be assigned to any system event you chose,
non?
loading a mouse driver would allow all sorts of setups, as all mouse
actions
would be interpreted by the driver and the way it was configured.
am I way off base here?

Theres one thing I think about every time I create the STOS Corner for
the Fanzine, that is...how many people actually read and enjoy it.

The next issue sees the start of a game creating tutorial and I
wondered, with it being such hard work to create such a tutorial,
would it be worth it.

Therefore, I would apperciate it if you could post your comments
either to this list or direct to me at Deano@zetnet.co.uk

So basically I am asking.....should I keep the STOS Corner or should I

drop it? After all, if noone reads it its a waste of time.

Also, if I wrote a manual like the Games Maker Manual by Stephen Hill
which showed in detail how to write various programs like games,
databases, art packages etc and sold it at a reasonable price would
anyone be interested. If so, please send me an email with New STOS
Manual as the subject, and if enough people show interest in
purchasing such a manual then I will write it.

 Yours Faithfully (In a very Silly way)

: >  move.w   d5,(a1)+
```

: >where d5 is an unused register.

Hmm, shouldn't the ror.l and rol.l be ror.w and rol.w?
Anyway, if this is supposed to do what I think it's supposed to do,
it just converts a pixel with Falcon bit-ordering to a little-endian

(intel-style) 15-bit pixel:

Falcon bit-order: rrrrrgggggxbbbbb
(where x is either an overlay/genlock bit or an extra green bit)

NOVA bit-order: bbxrrrrrgggggbbb (where x is an overlay/genlock bit)

In C this would be:

```
dest = (src >> 9) | ((src & 0xff00) << 5) | ((src & 0x1f) << 9);
```

This would be _much_ slower than the assembly code, though...

: I have what I think is the complete source and other related files
: needed to compile this under Pure C.

Is the source commented? If so, you'd just have to look up the plot or line-conversion routines (whatever it uses) and modify them for the NOVA pixel format. (Does the NOVA have a 16-bit mode? If so, you could simply swap the bytes in the output pixels)

: If anyone thinks they might be able to help out, it would be worth an
: HBS T-36 for their ST/MST

What's that then? :)

Newsgroups: comp.sys.atari.programmer

Greetings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site
and download it from there. Also UFOST issue 1.

There has been a few bug reports mailed to me so this issue is the NEW
version, V1.1
Bugs are mostly end of files been cut off and a few files which were missing
off the disc. A few other Shell bits have been updated as well.

http://www.users.globalnet.co.uk/~mega01/

MEGA Issue 2 is on 2 discs and has over 200 articles covering just about
everything we can think of. There should be something there for everyone.
If there isn't then why not write about it or suggest new pages. If you
don't then we won't know will we !!

Also UFOST issue 2 is available, Dedicated to UFO's abductions and

sightings. Not to be missed if you are interested in this type of thing.
This is produced by Lee Round.

If you would liked to be mailed issue 2 of either disczine then send your E-mail address and request it. I will then Mail it to you. Or you can wait until it is uploaded onto my site.

Please contribute to MEGA & UFOST and support it, else it will be one more nail in the coffin for ATARI. Any articles are welcome, If you have idea on one
why not mail me and tell me about it.

All comments and suggestions are more than welcome. Please feel free to mail me at any time. Any support you can give is gratefully received.

Tell me a little about yourself, It will help me in producing MEGA if I get some idea on what people like to read about. Don't hide behind you keyboard, let the world hear you...

Mail me at. mega01@globalnet.co.uk Now for issues.

Please take the time to send a letter to Lee Round (UFOST) else he may not produce future issues, Currently he has almost completed issue 3. Please take time to send him a article or 2, A blank disc is not very encouraging.

If you want issue 3 then send a letter to Lee (not on the net as yet) and request it from him. Issue 3 will be uploaded onto my site, but not for a while.

Send a disc with a S+E to

Lee Round (UFOST)
23 Fellrose Court,
Pelton Fell,
Ch-Le-Str,
Co Durham,
England,
DH2 2QB.

Tell him that I sent you (Chris Swinson).

Please support MEGA NOW, If we don't get some REAL support for issue 3 then we may not produce another zine, Its up to you .

If you would like to help but don't know how then please feel free to ask me waht you can do.

From Chris Swinson (MEGA DISCZINE)

http://www.users.globalnet.co.uk/~mega01/

>I can't remember how you subscribe but you should be able to find out at

You can "update" the KGMD very easy! cat all files together und untar them.
(cat compiler.a* | gzip -dc | tar -xf -) after them you got the usr/ and
var/ tree including all the files you need. The next step is to update the
old (2.5.8) binarys/libs with the new compiler (2.7.2) in the binary and
the lib dirs.

Don't know where to get the new files 'cause i have all on CD :-) but search
for it with any searchengine.

bye

> Therefore to pay nothing is to pay what it is worth. i.e. Paying
> nothing, or 'piracy', is actually a lesser form of piracy than it is
> for a (presently) commercial product.

Firstly, Lattice C at least is still sold commercially. Secondly, the amount of damages a company may sue for a copyright breach would depend on the country. In the UK the courts would only award compensation and that is based on the amount of money the company have lost due to the copyright breach. However, in the USA and some other countries the copyright holder can be awarded punitive (or punishment) damages this would add up to a lot of money, the amount would depend on the means of the thief since the award is designed to punish.

> You do realise that typically 2nd hand software is illegal, don't
> you? Look at the license agreement for most software - you can't pass
> on the license to a third party.

Any such statement is invalid. Copyright only covers the copying of software
it does not cover the sale of materials that it happens to be resident on.
Selling software second hand is like selling a book.

> If you look at copyright over software in a similar way to trademarks,
> it's only illegal if the owner enforces it (no, I'm not suggesting
> companies pay to enforce it. i.e. that they exercise the copyright by
> still making copies, or by distributing it as (non-free) shareware.

This is of course true.

> Hey, I just want to be able to scavenge in the dustbin for stuff
> that's past its sell by date.

The expiry of copyright is 75 years after the oweners death.

> Who's looking to buy a 2nd hand copy of GFA basic - anyone wish to
> aid and abet me in this crime?

What crime? :*)

John.

Any chance you could make this available via fidonet technology? This
way it
would reach many Atarians who like myself do not have full net access.

John.

Is there anyone who has used the FALCON soundsys call:
long setinterrupt(src_inter, cause) ?

According to the developers toolkit it is supposed to set
up either a timer A or a MFP i7 interrupt.
But when i try to use it in an audio player program of mine,
I can only detect one MFPi7 interrupt. I thought it should give
a interrupt every time the play or record pointer hits the end of
the buffer. But it seems like it only occures when the playback or
record is stopped by changing the buffoper mode.

I want to use this interrupt if posible instead of having to check
the pointer continously to pass the half of the buffer before
refilling it.

regards, arjan

Hmm, I just thought. My C++ is pretty poor and I've not used try/catch
myself yet. However, C++ Bulder wraps a Windoze application up in one.
If I understand it correctly then C++ will unwind the stack to whoever
catches the exception but it'll also have to call all the appropriate
destructers? If so, how do you simulate those with setjmp/longjmp?

(free'ing dynamic memory is what I'm thinking of rather than the local
stack frames)

>us to run into features like this.

A method I've used to good effect in the past is to put the speed
critical sections into their own function(s) but keep them as C until
the program is debugged and working. Then I replace those functions
with asm. The original C versions can always be used for an initial
port to another compiler (or machine I guess).

[snip 1st bit]

I aggree with Peter that it is stupid but as you'll see in that
response I have a slightly different reason.

Use the "environment" pointer of Pexec() when you execute PGP to set
up the password variable and value. When PGP returns the old
environment will be restored. (Ideally you should duplicate the entire
environment and add your bit in).

I certainly agree which is why I almost always choose to use unsigned
bitfields. Sometimes (very rarely) it is handy to have a signed
multibit bitfield though.

>I don't quite know about ANSI C though.

I see. It looks like there might be a (deliberate?) oversight in Mwc.
Okay, you say that a bit field is not an "int" but "unsigned" is taken
to be "unsigned int" thus it follows that the natural size for an
"unsigned" bitfield would be sizeof(unsigned int) anyway. I dunno!

>> have the impression that ANSI only allows "int". I could be wrong

This is good to hear. Signed bitfields are not as useful as unsigned
ones and don't make a lot of sense for fields which are only one bit
wide!

>if all you wanted to find out is if you run in Super mode ...

Certainly on Atari systems as entering superstate is permissable. I
would hazard a guess that such abilities are extremely rare on other
systems.

Yeah. If I'd thought about it a little more. After all my waffling
about fields in structures and how they *might* be represented, then
there wouldn't be any particular rule on how bitfields were
represented either!

You pass it to shel_write() in the same way as for Pexec().

Have a look at my other response in this thread. In fact there is no
need to use shel_write() at all. If you've disabled the PGP output and
your program has to wait for PGP to finish then there's no point
launching PGP as a parallel process in the first place, so Pexec()
will do just fine. :-)

You have to tell the MFP that the interrupt is served
Example:

```
asm{
     bclr.b  #7,0xfffffa0f       ;tell MFP that the interrupt is served
     rte                         ;return from exeption
}
```

and here is a working initiate code

```
/*****************************************************
 Description : Init end-of-sample interrupt

 Entry       : None
 Exit        : None
*****************************************************/
int init_sound_interrupt()
{
     long adr;

     Jdisint(15);

     old_sound_vect = xbios(0x0d,15,EndOSINT);

     setinterrupt(1,1);

     adr=Super(0L);
     asm{
          bset.b #7,0xfffffa03 ; set active edge in MFP
     }
     Super(adr);

     Jenabint(15);

}
```

and a working restore code

```
/*****************************************************
 Description: Restore and disable end-of-sample interrupt

 Entrys     : None
 Exit       : None
```

```
*****************************************************/
int restore_sound_interrupt()
{
     long adr;
     Jdisint(15);

     adr=Super(0L);
     asm{

Ermm, the Sinclair QL, was definitely true preemptive multitasking, you
could even set the priorities and stuff.

You can't automagicly deallocate allocated memory with the C try...catch
implementation using the setjmp() longjmp() functions, wish it could.
You have to deallocate malloced RAM yourself. Every malloc() free() pair
has to be allocated within a try...catch block so you can free the
allocated RAM on exceptions and then rethrow the exception.

I am using macros like
#ifndef NOT_USE_STD_find_dictionary
around functions (here find_dictionary). If the macro is defined
the standard function is replaced by an alternative one. It might
be an assembley version, or an optimized C or whatever. As long
as the linker can find the alternative function all goes well.

The macros are comming from a headerfile with settings. There
every system and compiler can define which original functions
to keep and which to replace.

Cu, Hans

Why don't you just write that in C?

```
     *(volatile char *)0xfffffa03 |= 0x80;
```

Are there any drivers available for the Lan port on the Falcon?

There isn't by any chance anyone around who happens to have
a complete tcp/ip implemantation lying around, is there :)

Thanx in advance

Zzap.

OK, guys, here is my little contribution to the subject:

I've own Ataris for mor than 10 years, it is IMHO one of the best designed computer systems of all times, but, as time goes by so computers, i don't own PC's, but i work with them all day long, the main reason i don't wanna buy a PC is the tech groundbreak, i've been thinking buying one just because i want APE for my Atari, anyhow, i don't think Hasbro or anyone will take the A8 out of the basquet, the many out there who own one of the newer game consoles know exactly why, in the meantime we are seeing a resurrection of old 8-bit tiltes, the last one, i think, is robotron for the N64.... So, games we will see lots of resurrections, systems, i don't think we'll see any.... Still, i buy any piece of A8 hardware that crosses my path.

Javier.

The copy of K&R v2 that I looked in (a Swedish translation) stated clearly
that both unsigned and signed int are OK as bitfields.

>>any sense. A bit is unsigned by definition; a signed one would mean the
>>one bit is taken as the sign, and zero bits for the absolute. That's silly
>>isn't it ?

What's silly is the idea that C would use sign-magnitude integers!
I know there have been one or two computers that have done that, but it's
very uncommon.
All modern computers use two-complement integers, where a single bit can
well be signed (with the possible values -1 and 0).

>>> Mwc accepts both unsigned and signed for bitfields and the sign is
>>> taken into account. ie "int fred:1" when set to any non zero value
>>
>>The compiler should not accept this, as a bitfield is not an "int". Note
>>a bitfield is declared by
>>
>> unsigned fred : 1
>>
>>and not
>>
>> unsigned int fred : 1

In C, 'unsigned' is a synonym for 'unsigned int'.

The K&Rv2 I checked clearly states that bitfields must be specified as
'int' and it recommends adding 'signed'/'usingned' for portability.

If you decide to 'go PC', I suggest trying Linux or
FreeBSD first. They, as unixen, tend to be a bit
harsher on newcomers but, they're much more reliable
than WinXX and perform better (more responsive) on
similar hardware. You will likely be quite shocked

with how much computing horsepower it takes to just
do basic computing with WinXX.

The Atari should be able to read DOS formatted disks, at least if you
format them to 720kB.

iirc, you'll find the dimensions of the iconified window in the
message buffer associated with the WM_ICONIFIED message you got from
evnt_mesag(...) or evnt_multi(msg[8]). Simply ...

wind_set(WF_ICONIFY,msg[4],msg[5],msg[6],msg[7])

Zoom + Interface are commercial, but I've heard of a new (free?) RCS called
"ResourceMaster". Does anyone know where to find it?

Ciao,
     Lars

David, I also want to know, when you find out, pliz tell me.

I basically need to use ICONIFY (of the aes), but without having a
ICONIFY widget, I don't know how to make it to work.

Thanks

correct when you are iconifying after receiving the WM_ICONIFIED message but
I wish to iconify from a menu entry.

David

I am running Windows 95 on a 486DX-66 and it runs decently. Seems almost as responsive as my Macintosh at work (7200/75). I run Microsoft Office products and have never had a complaint about performance.

I would like to try Linux but it does seem intimidating. Also, where does one get software for it (like word processing, graphic)? This is an honest question.

I think you can do it by doing this (Anthony, correct me if I'm wrong):

wind_set(WF_ICONIFY,-1,-1,-1,-1);

I have not tested it my self, but I think this works.

There's a free (not for profit) office suite called Star Office available for Linux. I've got it, I use it very occasionally. I end up using Word 97 more often because I don't get the same quality print in Linux that I do in Windows. I'm using a Canon BJ-200ex. Printing in Linux is primarily done with postscript, so if you have a postscript printer you should have no problem. I, on the other hand, don't so I have to use a postscript filter (apsfilter) to make it work with my printer...and then I have to use a BJ-200e driver (which is half the resolution).

StarOffice is not bad. It supports conversion of various format documents (albeit, not Word 97, but will do Word 6.0). It has everything you'd expect in a word processor. I especially like having the mathematical formula editor...which comes with the package.

     Ouch! 95+Office+486?

>

     The major linux vendors distribute it (like Redhat or Caldera)
     and you can find it in places like *linuxmall*. For games that
     have been 'un'released, you can just pick up the game at CompUsa
     and download the Linux version of the executable (QII, UO).

     There's also a 'freeware' ST emulator called STonX that
     you might want to try out. You'll have to provide ROM
     images however (not hard to find on the web).

     Linux will likely run more responsively on the hardware
     you're using now. Although, unless you have lots of ram,
     I would not expect much out of either '95 or linux.
     Although Linux is a lot easier to trim and tune.

I never found the performance of M$ OSes to my liking.
I also found the registry and plug-n-pray quite annoying
as well.

oic! In this case send yourself a WM_ICONIFIED message with msg[4..7]
set to -1 (or simply wind_set(WF_ICONIFY,-1,-1,-1,-1) but the first
method is better imo). When you get the WM_UNICONIFIED message simply
interrogate WF_PREVXYWH then pass those values to
wind_set(WF_UNICONIFY).

This will get you started ...

```
typedef struct     {
int16    x,y,w,h;
}    Rect;
#define  PRECT(a)  &a.x,&a.y,&a.w,&a.h
#define  NIL       -1

main()
{int w;
 Rect    rr;

 appl_init();
 w = wind_create(NAME | MOVER | CLOSER,100,100,100,100);
 wind_open(w,100,100,100,100);
 evnt_timer(3000,0);
 wind_set(w,WF_ICONIFY,NIL,NIL,NIL,NIL);
 evnt_timer(3000,0);
 wind_get(w,WF_PREVXYWH,PRECT(rr));
```

```
 wind_set(w,WF_UNICONIFY,rr);
 evnt_timer(3000,0);
 wind_close(w);
 wind_delete(w);
 appl_exit();
 return 0;
}
```

It does. Still better to rely on the user clicking the ICONIFY gadget
though. ;-)

Thanks Erik, that should do the job ;-)

But why do you use nr 15 in Jdisint, Jenabint and the xbios call? According to the
help in pure-C number 15 is is the monochrom-monitor detect interrupt???

best regard, arjan

Eagle will be nice and all. However, most Atari's
still floating around now are still limited to 4M
which for GEM is nice but for Unix even in curses
mode, it's a bit cramped. That's just the RAM,
mind you, and not even getting into storage...

Many years ago (1989) GST (who sold 1WP) published a /1st Word Plus/
/Software Developers' Guide/ that had all the info you need. Long out of
print, but I could sell you my copy for what I paid for it then, 3 UKP if I
recall right, plus postage. Or 12 International Reply Coupons. :-)
If you are only after the text styles, then you can read about it in the
IdeaList manual. It uses a similar arrangement except that it shifts the
Escape characters down by $20 so that they can be typed from the keyboard

Alternatively, take a look at the Shareware TUC universal converter, which
has a module for 1WP conversion included. Studying it will tell you what
substitutions are necessary.

Regards
        /Peter/

> environment and add your bit in).

At present I'm passing it on the command-line. However this way restricts
the maximum length of the password to 26 chars, and the email addresses to
32 chars. While this may be long enough for PGP to distinguish between the
names/addresses, I don't think that the password is long enough. I'm just
doing a small rewrite of that part to extended the length to 48 chars, which
I think is about right, and pass it via the environment instead. If it
works, I'll lengthen it to a maximum of about 62 and do it that way.

I did manage to get the output from PGP down to a bare minimum. It still
displays a single message on-screen to say it's created the clear-sig.
Apart from that, there is no other output, even for a password error.
Instead of displaying an error message, it just quits, and since I'm
ignoring any errors from PGP ATM, it is as though PGP wasn't called. I'll
put something in to let the user know if, and what type of, error occured
later.

The last step wont work very well if you of some reason have moved the
iconified window (or maybe this is a special case?). So it's better to
save the position before iconifying it like Anthony said.

> > TOS 1.02 is often mentioned as TOS 1.2
> > TOS 1.04 (Was in another dead ST i found) is sometimes confused with TOS 1.4

Not confused, same version. Different programs would report the version numbers differently. The short explanation is that version numbers are stored as major and minor 16-bit words. So if you read the major of 1 and minor of 2, that was TOS 1.2. Then Atari decided to make the versions read as hundreths, i.e. 1.02, 1.04, 1.06.
However that broke down somewhat when the patched version of 1.6 was released, since the minor of 1.06 was 6 but 1.62 had the minor value 62.

> So where does this 1.09 fit ?

Could be someone's patched release. Over the years a large number of "patch" codes have been released by programmers that fix various bugs or improve certain routines in the ROM. The "WinX" ROMs come to mind as perhaps the better known.

> "Little Guide to TOS Revisions, version 1.0" written by John Townsend

>
> ROM TOS (1.00)
> MEGA TOS (1.02) with blitter support
> RAINBOW TOS (1.04) blitter, GEM autorun, foldrxxx patch.
> STE TOS (1.06) supports STE hardware
> STE TOS rev 2 (1.62) fixes bugs in the above.
> Mega STE TOS (2.05)

And TOS 2.06 which was made more hardware independent and would fit in any machine that could address the &E placement of a ROM.

Generally, only even numbers were official releases.

> I think it's 14Mb, but only if the MMU is able to address that much
> memory, which doesn't seem to be the case on any ST/STE machines.

True. Some motherboards require that a couple of new address lines are
soldered to the MMU holder. Others may require a change of MMU.

You should find that the file will print OK even if it does not
display properly. It is only the keyboard/video -> ASCII mapping which
has been fooled.

>Hope that somebody has an idea how to get the right characters or to
>transcript the atari txt files.

If you want to change the keyboard mapping use KEYEDIT.PRG. It will
produce and AUTO program which will change the mapping at boot-up.

: want to get up to speed quick in Windows, at least for dialogue boxes.
: Is it going to be that much more difficult? Or easier? Any
: recomendations of good books?

It's certainly more difficult (more complex), as Winows has loads more functions than GEM. Of course this can be a good thing, as you don't have to write your own functions for everything.
I'd probably have to suggest the books from Micros*ft themselves, as these are pretty solid and use plain C and are the only ones I know. :-)

: I bought one book for Windows programming in the C++ language, but then
: of course I'll have to learn C++ first. I'd rather do the Windows
: programming in C and learn C++ later.

I've seen a lot of "Learn Windows programming in *** in twenty days" type of stuff. Avoid these. *A lot* of programming for W*ndows is done in C++, by the way. These guys really love the OO stuff (just have a look at the adverts in Dr. Dobbs)

: I'd love to have an expert Atari C programmer write a tutorial that
: would compare programming the Atari vs. the PC for Windows.

Not likely to happen. :-)

: BTW, the ST computer isn't being made anymore is it?

Nope.

: When was the last one made?

Err, a while back. (I think early nineties, the STE)

: Is there actually any serious programming still being done for
: the Atari?

Certainly, what d'ya think this newsgroup is for?

: Is it still popular in Europe where I think more were sold.

Probably more so than in eg. the US.

Hi,

I have installed MintNet with KEMD 2 (K. Ellis & Frank Bartels are great people !). I installed the Basic + Net packages, plus some other tools.

It all works fine now, I even have NCSA 1.3 httpd running. PPP works, SLIP works, in other words : just perfect.

But now I want to add gcc + libraries + g++ (it does exist for Mint, doesn't it ?) on my system. Of course WITHOUT reinstalling all the other packages again or erasing my file system. Is this possible ?

If so, where can I get the compilers + libraries (recent versions?) ? An ftp URL would be great.

My last question : do lex, yacc, bison or flex exist for Mint ? Again : where do I find them ?

Thanks anyway,

```

: a really basic Basic course at college ten years ago I haven't programmed
: anything other than a TI58-C calculator at school (fifteen years ago)....are
: there any books, example source-code for MIDI handling, tech-yourself guides
: etc,

I would suggest you first get a decent book on C programming (K&R seems to
be the best). When you've got the hang of that, you should go looking for
docs on MIDI protocols (books or internet docs, try a websearch)
You'd also need to know something about addressing the MIDI ports on the
Atari and possibly about writing a user interface. MIDI I/O is done using
simple GEMDOS calls, so a simple GEMDOS reference manual should suffice
(again, a book (the Atari Compendium) or one of the online docs (try the
various Atari FTP sites, there should be a GEMDOS reference manual
floating around somewhere. I might even have a working link on my Homepage))
For the latter (GEM programming) I suggest you have a look at "Professional
GEM" by Tim Oren, which is available on several FTP sites.
Good Luck!

Jens,

Quite frankly, I don't see what is your point...

In article <Pine.OSF.3.95.980404090127.17586A-100000@tellus.dsv.su.se>, Jens M Andreasen <jens-and@dsv.su.se> writes:

```
>: - A compiler has no way to know where a pointer points at, generally speaking.

>This might crash or return various amounts of junk depended on
>what p2 actually points to. It is up to the programmer to stay
                             ^^^^^^^^^^^^^^^^^^^^^^^^^^^
>within limits :-(
```

Well, so it is the programmer's duty and not the compiler's, and you agree with me ;-)

```
> * but if we try:
>++p; /* works */
>++array; /* error */
>/* Wow, the compiler actually knew that
> * an array is not a pointer :-)
```

'p' is a variable symbol, 'array' is a constant symbol, this is the reason for the error. This is another issue than knowing where we are pointing at.

Also note that, if instead of using a constant index, one uses a variable index, say array[i], then the situation for the compiler is exactly the same with the array than when using a pointer, i.e. it has no idea of the validity of the operation it is performing.

Cheers.

if you want to install some extra package from kgmd without
reinstalling the whole thing, you can get all the files you want,
Example:
compiler.aa, compiler.ab etc etc
then: cat compiler.* >>compiler.tar (was it tar.gz? try both)
then untar or untgz this new file.

> If so, where can I get the compilers + libraries (recent versions?) ?
> An ftp URL would be great.
you can get gcc 2.7.2 (2.7.2.3 too) from several atari ftp.
Along with newer libs. try ftp.funet.fi etc. or you can start from my
homepage, from there you'll see some mint links.

>
> My last question : do lex, yacc, bison or flex exist for Mint ?
yes. (along with m4, perl, python etc)

> Again : where do I find them ?

check my www page, some interesting link for minters.

Hi Jose,

> I have the Lattice C compiler, Turbo C and another; but because they
> have been downloaded from Internet I do not have any manuals.

These products are commercial, you realise that you are incriminating yourself and leaving yourself open to prosecution. You can buy a second hand copy of Lattice with all the manuals perfectly legally for about ukp20. I'm sure you've made an honest mistake here and will delete these infringing copies immediately. If you really want a free compiler try GNU C.

> I need to
> make a program using Dialog Boxes, Menus, and all that GEM stuff. Can
> any one help me?

A good tutorial was written by Tim Oren, it is available in two files one contains the text and one the source code. It should be available from most Atari archives and BBSs.

John.

PS. Please think about what you are doing if you continue to use this pirated software, especially in todays fragile Atari market.

The avserver name is 'AVSERVER' which is 8 characters. I would need
this expansion to work with other avservers, but this should not be
significant with the 'AVSERVER' name.

Greatings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site
and download it from there.

www.users.globalnet.co.uk/~mega01/

Issue 2 is on 2 discs and has over 200 articles covering just about
everything we can think of. There should be something there for everyone.

If you would liked to be mailed issue 2 then send you E-mail address and
request it. I will then Mail it to you. Or you can wait until it is
uploaded onto my site in a few days.

Please contribute to MEGA and support it, else it will be one more nail
in the coffin for ATARI.

All comments and suggestions are more than welcome. Please feel free to
mail
me at any time.

Tell me a little about yourself, It will help me in producing MEGA if I get
some
idea on what people like to read about.

Mail me at. mega01@globalnet.co.uk   Now for issue 2.

Chris Swinson.

Hello all ATARI lovers.

UFOST issue 2 now avaliable by Lee Round. UFOST is another disczine
for the Atari range of computers.

UFOST is a new UFO based zine covering all UFO abductions, encounters and
sightings plus a lot more.

Keep an eye on my web site for issue 2 or mail me if you cannot wait.

Please take the time to send a letter to Lee else he may not produce future
issues, Currently he has almost compleated issue 3.

If you want issue 3 then send a letter to Lee (not on the net as yet) and
request it from him. Issue 3 will be uploaded onto my site, but not for a
while yet.

Send a disc with a S+E to

Lee Round (UFOST)

Peter, and group,
This may appear controvercial, as amongst other things I wish to
'greyscale' piracy.

Firstly, it's not so much a legal issue, it's more of a moral issue. In
several countries piracy is legal. However, the residents of that
country still have a very hard job of describing it as moral.

I also believe in some ways that products which are no longer sold by a

company or its distributors, (deep breath) have no value to the company. Therefore to pay what they are worth is to pay nothing. Therefore to pay nothing is to pay what it is worth. i.e. Paying nothing, or 'piracy', is actually a lesser form of piracy than it is for a (presently) commercial product.

You do realise that typically 2nd hand software is illegal, don't you? Look at the license agreement for most software - you can't pass on the license to a third party.

If you look at copyright over software in a similar way to trademarks, it's only illegal if the owner enforces it (no, I'm not suggesting companies pay to enforce it. i.e. that they exercise the copyright by still making copies, or by distributing it as (non-free) shareware.

Hey, I just want to be able to scavenge in the dustbin for stuff that's past its sell by date.

Phil Carmody

Who's looking to buy a 2nd hand copy of GFA basic - anyone wish to aid and abet me in this crime?

PS. Anyone got a GFABasic -> C converter whilst I'm about it, or do I have to write one myself? (I have thousands of lines of GFA stuff I wrote when I was a wee nipper with an ST, but now I'm a C boffin)

The Atari ST reads both single-sided and double-sided
single-density and double-density diskettes using the
same format as IBM clone computers.

The Atari Falcon additionally reads single-sided and
double-sided HIGH density diskettes using the same
format as IBM clone computers.

Cheers!

> if all you wanted to find out is if you run in Super mode ...

That's exactly why reading the SR became a privilidged instruction
on the 68010 and later. It should be impossible to figure out whether
you are in supervisor mode or not. This to make perfect virtual machines
possible.

So it should be possible to have a program running in user mode,
but the program itself thinks it's in supermode. All privilidged
instructions will be trapped and emulated by a higher level program
so the environtment looks exactly like a super environment. This
would be spoiled if reading the SR would be a user instruction; it
wouldn't be traped so the super bit can't be set.

Cu, Hans

AFAIK single density means FM format (low level format mode, usually MFM
is used). The ATARI's floppy controller can read and write FM disks, but
you need a little hardware modification. Besides, I never saw those.

> The Atari Falcon additionally reads single-sided and
> double-sided HIGH density diskettes using the same

There should be no single sided high density disks...

You can implement the C++ try...catch megansim in C using the
setjmp - longjmp functions. The try...catch meganism is (IMHO)
a very elegant way to deal with errors; no need for checking
error flags function results for error values. When a function
stumles on an error it simply throws an exception. The part of
the program dedicated to error handling will catch it and handle
the problem.

> >Different behaviour is observed from
> >different compilers.

> exist if the functions themselves did not.

Yes, but the big problem is a lousy definition by the standard.

> After all, the same effect can be obtained simply by linking in a
> function written in assembler.

That wouldn't be portable. We are using C for our ARJ project because
C is very portable. Trying to exploit the language to the maximum caused
us to run into features like this.

> >> In effect I'd be happy to code this ...

I mean the second bit for:

```
{
  x = *fred;
  x = x + x;
  *fred = x;
}
```

> Similarly with reading - what if two items are mapped onto the same
> hardware address and it toggles between them. The first time you read
> it, it could be fred, the next time it could be some status value.

Yep, you are completely right. Now I understand what you were trying
to say.

Bye, Hans

Hi!

In article <6fordm$1dm$1@roch.zetnet.co.uk>,
     rcain@zetnet.co.uk (Roger Cain) writes:
> Way back in the distant past I remember there being a program called,
> believe it or not, CAUTO which did the job you want.

Just to do some advertising, AutoMore (you may find it at
ftp://ftp.uni-kl.de/pub/atari/automrr6.lzh) also offers this and a lot of
other stuff ;)

Ciao

Thomas

: compiler.aa, compiler.ab etc etc
: then: cat compiler.* >>compiler.tar (was it tar.gz? try both)
: then untar or untgz this new file.

 OK. Does anyone know what the exact content is of this package ?
 (Version numbers, libraries, gcc or g++ etc.)

: > If so, where can I get the compilers + libraries (recent versions?) ?
: > An ftp URL would be great.
: you can get gcc 2.7.2 (2.7.2.3 too) from several atari ftp.

 I found it and fetched it. Thank you very much.

: Along with newer libs. try ftp.funet.fi etc. or you can start from my
: homepage, from there you'll see some mint links.
: > My last question : do lex, yacc, bison or flex exist for Mint ?
: yes. (along with m4, perl, python etc)
:
: > Again : where do I find them ?
:
: check my www page, some interesting link for minters.

 Well, I did. I followed ALL links related to Mint and the only thing I found
 was Bison (which is a start). I couldn't find any reference to lex or flex.
 Does anyone know whether these exist for Mint, and where I can find them ?
 I even looked in the mailing list, but nothing there...

 Thanks anyway,

Sure, just unpack the tar.gz archives in your rootdir and remove the old
gcc and cc symlinks... (see installation docs for gcc 2.7.2)

: If so, where can I get the compilers + libraries (recent versions?) ?
: An ftp URL would be great.

site: ftp://ftp.fu-berlin.de/pub/atari/
dir: mint/gnu/

Although for some reason GCC 2.7.2 (both 68000 and 680x0 versions)
crashes with a bus error (in cc1) after a while every time I try to compile
something with it (anyone know why?), so you might be better of with 2.6.x...

: My last question : do lex, yacc, bison or flex exist for Mint ?
: Again : where do I find them ?

Same site, in mint/tools or gnu/ (non-mint?)

Well David, I tried a search on the Web using the almighty MetaCrawler
(www.metacrawler.com, you know), and surprisingly found flex for Mint.

In case any other Minters are interested (that's what newsgroups are for),
here's the http URL :

All gnu-C text processing tools can be found there.

Bye,

A quick check of Windows95 shows support only for
720K and 1.44M diskettes -- i.e., double-sided only.

Another reason to consider the Atari.

Hi everyone,

Well supplies are almost exhausted, I only have a small handful of Atari/Riebl Ethernet cards remaing with Atari ANS network drivers, I have 1, possibly 2 Atari Mega ST network cards left: $150 each

I have 4 Atari/Riebl Mega STe/TT030 VME bus ethernet cards left: $150 each

I have 6 Atari DMA MetaDOS ASCI network cards with MetaDOS drivers, these need SF354/SF314 type power supplies, do not have cases and are more suited towards hardware hackers who want to play around with these: $50 each

I Have 1 left Image Systems Atari Mega ST video card with amazing color and resolution capabilites with all drivers: $350

Thats about it, all other supplies are exhausted, sorry guys this is you last chance at these, I am taking email reserves, send me an email and I will reserve a card for you for 2 weeks until payment is received.

Curt

Greetings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site and download it from there. Also UFOST issue 1.

http://www.users.globalnet.co.uk/~mega01/

MEGA Issue 2 is on 2 discs and has over 200 articles covering just about everything we can think of. There should be something there for everyone.

Also UFOST issue 2 is available, Dedicated to UFO's abductions and sightings. Not to be missed if you are interested in this type of thing. This is produced by Lee Round.

If you would liked to be mailed issue 2 of either disczine then send your E-mail address and request it. I will then Mail it to you. Or you can wait until it is uploaded onto my site.

Please contribute to MEGA & UFOST and support it, else it will be one more nail
in the coffin for ATARI. Any articles are welcome, If you have idea on one why not mail me and tell me about it.

All comments and suggestions are more than welcome. Please feel free to mail me at any time. Any support you can give is gratefully received.

Tell me a little about yourself, It will help me in producing MEGA if I get some idea on what people like to read about. Don't hide behind you keyboard, let the world hear you...

Mail me at. mega01@globalnet.co.uk Now for issues.

Please take the time to send a letter to Lee Round (UFOST) else he may not produce future issues, Currently he has almost completed issue 3. Please take time to send him a article or 2, A blank disc is not very encouraging.

If you want issue 3 then send a letter to Lee (not on the net as yet) and request it from him. Issue 3 will be uploaded onto my site, but not for a while.

Send a disc with a S+E to

Lee Round (UFOST)
23 Fellrose Court,
Pelton Fell,
Ch-Le-Str,

Co Durham,
England,
DH2 2QB.

Tell him that I sent you (Chris Swinson).

Additional.....

Due to the mass response to both issues, I may have missed a few people who have requested issues. If you have not as yet received what you have asked for then please mail me back, Sorry to all who I have missed.

Thankyou for you time :-)

The pin DDEN (Double Density ENable), pin 26, is grounded. Make it high
and it wil write in FM format.

> : There should be no single sided high density disks...
>
> Well, there _could_ be... :-)

There are. Both 3.5" and 5.25"

[For those who haven't been following the plot, ICTARI is a disk-zine / user group for Atari programmers.]

Is ICTARI dead ? Not if I can help it, but I'm not sure that I *can* help

it. The latest issue is months late due to the slow trickle of contributions.

Want to know why your code doesn't work ? Send it for some constructive criticism. Got a programming problems ? -Ask. Want to share some routines ? -I'd be very gratefull. ICTARI can't continue without the cooperation of others, as the lateness of the new (short) issue shows. I will continue to try an make more back issues available, but surely ICTARI can still be a going concern ? Tell your non-netted friends and user groups, and please send me something worth publishing ! I can't have any enthusiasm unless someone else shows some.

In the meantime, issue 52 is at the usual place:

http://www.elis.demon.co.uk/ictari/ictari.htm

What it does have going for it is Mark Wherry's[1] new iPL scripting language.

Have Fun,
"Augeas"

[1] Mark, my mail to your HotMail account keeps bouncing.

 >>> 1.09, but, AFAIK, there never was a TOS version labelled 1.09.
 >> .
 ib> Erm My 520 STFM that originally has a single sided floppy drive DID
 ib> have TOS 1.09,

 From what I've read this is incorrect - there was /no/ TOS 1.09; it's
 just that some programs that tried to read out the TOS version got it
 wrong! This was in fact TOS 1.02 which first appeared on the Mega ST
 and supports the blitter. It came with GEM 0.19, which may be the
 source of the confusion.

 ib> TOS 1.02 is often mentioned as TOS 1.2
 ib> TOS 1.04 (Was in another dead ST i found) is sometimes confused with
 ib> TOS 1.4 TOS 1.4 is also called 'Rainbow TOS' as it has a multi
 ib> coloured atari symbol in the desktop info bit.
 ib> TOS 1.6 in in STEs and the last STFMs(the ones that has blitters) is
 ib> sometimes confused with TOS 1.62

 TOS 1.6/1.06 was in the early STEs (520 & 1040).

 ib> TOS 1.62 is in 99% of all STes
 ib>
 ib> Please correct me if i am wrong in any of this but it is what i have
 ib> learned after doing atari stuff (not on www) for the last 6/7 years.

 Yes, that's OK. The TOS version can be read with a memory editor at
 _sysbase+2 longs (16 bytes), which is $FC0002 with TOS 1.xx, in binary-
 coded decimal format. That will read 01 00 / 01 02 / 01 04 / 01 06/ 01 62
 etc. Some people thought that the second byte should be read reversed, in
 the Intel order, and it wasn't until the minor change from TOS 1.60 to
 1.62 came about that people realised this was incorrect. Atari themselves
 weren't all that logical about it -- I never understood why they didn't
 put the TOS version into the Info dialogue instead of just the
 copyright dates...

 Regards
        /Peter/

I hate to spoil your idea, but have you ever given it serious thought
what kind Atari you would need to run that ? Or will it be smth for
"future platforms" (like in the PC-world) ?

However, their might be some interesting things buried in that code...
...if you can read it... ;-)

I did some work on a program like this. You can find complete documentation for RTF format on MicroSoft's web site. There is *NO* published spec for the DOC format, MicroSoft keeps that private. You might be able to find some info from a web search; I haven't tried that.

RTF conversion to HTML is pretty easy for the most part; I couldn't decide what to do about embedded figures/drawings/graphics. I suppose the simplest

thing to do would be to render it into a 100dpi GIF file or something and
spit it out as a separate file.

Hey! Phil Carmody <papc@techprt.co.uk> wasn't it Mon, 06 Apr 1998
20:05:50 +0100 that you wrote:

>Firstly, it's not so much a legal issue, it's more of a moral issue. In
>several countries piracy is legal. However, the residents of that

If it's legal then why do they call it Piracy ?

>I also believe in some ways that products which are no longer sold by a
>company or its distributors, (deep breath) have no value to the company.

But they do have a value to people who own legally bought copies.....

>actually a lesser form of piracy than it is for a (presently) commercial
>product.

If it looks, smells, sounds and tastes like Piracy.. then chances
are.. its Piracy...no lesser or bigger, its all the same thing..

>You do realise that typically 2nd hand software is illegal, don't you?

Define typically and what laws you refer to.. Reselling in the UK is
NOT illegal.....Also when people pirate software, do they restrict
there piracy just to certain countries? I doubt it..

>Who's looking to buy a 2nd hand copy of GFA basic - anyone wish to aid
>and abet me in this crime?

I have seen adverts in this newsgroup many times from honest ATARI
users who want to sell a copy of GFA that they bought and no longer
need.. If GFA is now put out in pirated form then all our fellow GFA
owners will lose out... not fair surely ?

>
>PS. Anyone got a GFABasic -> C converter whilst I'm about it, or do I
>have to write one myself? (I have thousands of lines of GFA stuff I
>wrote when I was a wee nipper with an ST, but now I'm a C boffin)

Then why not make something instead of promoting piracy ?

There are other good reasons NOT to pirate software, for a start it
doesnt exactly help those of us still here programming... what chance
have we hobbyist making software if the internet gets flooded with
commercialy quality software for free download..

The trouble with Piracy is that the pirates are only thinking of
themselves.. not of existing programmers or honest people who own
software or the community they invade..

The ATARI platform does not want an influx of pirated software, and
you arriving in this newsgroup and telling everyone its right is just
showing that you don't care for the ATARI community....

Subject: Help : palette Degas Shifter vers VDI
Date: 1998/04/09
Message-ID: <6gjcin$6vu$1@news2.isdnet.net>#1/1
X-Deja-AN: 342531298
Newsgroups: comp.sys.atari.programmer

Salut a tous.

J'ai un big probleme a propos de la conversion de la palette 16
couleurs shifter (type celle du fichier PI1) vers le format VDI.
Ca donne :

SEEK #23,2

```
BGET #23,m_color1%,32
FOR i%=0 TO 15
  dummy%=WORD{m_color1%+sft2vdi&(i%)*2}
  INT{m_color2%+i%*6}=INT(AND(SHR(dummy%,8),&HF)*1000/7)
  INT{m_color2%+i%*6+2}=INT(AND(SHR(dummy%,4),&HF)*1000/7)
  INT{m_color2%+i%*6+4}=INT(AND(dummy%,&HF)*1000/7)
NEXT i%
```

avec

```
DIM sft2vdi&(15)
sft2vdi&(0)=0
sft2vdi&(1)=15
sft2vdi&(2)=1
sft2vdi&(3)=2
sft2vdi&(4)=4
sft2vdi&(5)=6
sft2vdi&(6)=3
sft2vdi&(7)=5
sft2vdi&(8)=7
sft2vdi&(9)=8
sft2vdi&(10)=9
sft2vdi&(11)=10
sft2vdi&(12)=12
sft2vdi&(13)=14
sft2vdi&(14)=11
sft2vdi&(15)=13
```

La resultat est completement aberrant. certaines couleurs sont les bonnes, mais pas toutes.
Quelqu'un pourrait me mailer la sol ? Please ! C'est pour que ca marche sur les compatibles Atari, au sujet d'un editeur de tableau 16*16 cases, pour bricoler un jeu par la suite.

Bye !

That is true, but how many virtual machines have we got ? Maybe this is
important for other platforms, but for us (me at least ;-)) it is more
important that sr read access being priviledged can be a bad handicap.

Cheers Peter

: My last question : do lex, yacc, bison or flex exist for Mint ?
: Again : where do I find them ?

I'm not really the right person to answer this as I'm not very familiar

with KGMD, but since nobody else has... I believe all that stuff is in the
KGMD compiler package. I think you can just untar the compiler package and
copy the extra items into your existing system. Someone else can tell you
where to get the most up to date versions, the compiler in the KGMD is
very old. Maybe you would be better off posting to the MiNT mailing list,
I can't remember how you subscribe but you should be able to find out at

http://aire.ncl.ac.uk/Atari/Mailing-Lists/MiNT-List.index.html

Whoops! Well, this is certainly my month
to state obvious inaccuracies with authority.

I'll go to my room now....

-- George Crissman
-- strads@tmisnet.com

... you know ... there's a project that doubles the
clock speed to the floppies so they can use the
high density format ... maybe there's another one
that halves the clock speed so that single density ...
nah ... maybe not.

Never mind.

hi, in order to work on a cpx I need some info about it.
 I am not using C, so the cpx header or lib that could exist won't
help directly.
I need to know this: How do I embed my window(fixed w and h as
someone told me (but don't remember the value off hand)) into the
control panel?
what if I move the control panel? what wm_moved message do I get?

(the header for the cpx is not the prob itself), I just need to know
about the redraw, move and parent tree.
Anyone helps me?

Thanks.

I think it depends on the atari computer your using. I use a mega/ste and
I transfer files between my dos machine and the atari all the time. I
usally format the disk in the IBM. I find the only times it don't work is
when I make directories on the disk or delete some files from it. If you
could fromat the disk in DOS format copy the file to it and do nothing
elase it might work. Also, I think there are programs out there which
allow atari computers to read dos formated disks. Don't hold me on that
though. If you've got internet access search some of the shareware search
sites.

Scott.

 Yes. "Zoom" is designed to develop icons in RSC files. It can even import
 (or export, I'm not sure) Windows 3.x iconfiles.
 "Interface" kan incorporate images in RSC files (might be .IMGs) AFAIK.

Such a call would only be of use to the rest of us if they implemented
a module which could be applied to older Gem versions giving the same
functionality. Unfortunately such a thing is highly unlikely and more
probably - nearly impossible. :-(

What is possible, is that such new functions as are developed are run
by the MagiC and Geneva authors. At least there would be a slim

chance.

Yep. Naturally memory protection will make a difference but only if we don't make the necessary declarations.

I'm not sure which of the above you are saying is "the case" and which is "not" so we may or may not be agreeing below ... <g>

Structs should present no problem. The base address and the upper limit are both known. I see no point in implementing hardware protection for structs however, as these can be trapped during compilation. Similarly, an array base address is always known and the upper limit might be and again I see little advantage in setting up hardware protection during these accesses either. Protection for different segments is extremely useful as would be comprehensive protection for dynamic memory.

I ought to get both as MWC is mainly K&R :-)

>
>And put it back in storage after the variable is modified.

Oops, yes. I got carried away and forgot that bit!

Strictly, I believe the requirement is only to put it back in storage when an "assignment" to it is made. I haven't considered if this slight change in terminology actually makes a difference or not, as it would only leave us with another unknown (ie that some modifiers may not technically be assignments!).

>It's
>very usefull vor variables that are changed by interrupt routines.

Yes. It is imo, about the only time I can see a use for it (hence my complete inability to see any use for structs being volatile by

default).

In effect I'd be happy to code this ...

```
volatile int  *fred;
int      x;

x = *fred;
x = x + x;
*fred = x;
```

... whereas I'd be worried about this ...

```
*fred = *fred + *fred;
```

A second use is to force coorrect behaviour when using the
setjmp - longjmp functions. The C-standard is not quite clear

on the use of these functions, esp. on what should happen to
register variables. Different behaviour is observed from
different compilers. Pure C and Dec C (for Alpha) restore
register variables into their original state (saving the
processor status). GCC and MVC don't. Using volatiles
solves that problem.

```
> In effect I'd be happy to code this ...
>
> volatile int    *fred;

> ... whereas I'd be worried about this ...
>
> *fred = *fred + *fred;
```

Don't see a problem here. Maybe you are thinking too
much in assembly here?

```
    add.w   (a0),(a0)
    add.w   (a0),(a0)
```

But then also

```
    move.w  (a0),d0
    add.w   d0,d0
    add.w   d0,d0
    move.w  d0,(a0)
```

Which makes no sense.

Our are you troubled with fred changing between
the two readouts? Then you will have to make the
operation atomic, with functions like

```
enter_critical_section();
*fred=*fred+*fred;
leave_critical_section();
```

Bye, Hans

What exactly is TOS 1.09?

From the late 1980s, British Atari mags frequently mentioned TOS 1.09,
but, AFAIK, there never was a TOS version labelled 1.09.

From descriptions of it, I am led to believe that it is really TOS 1.02
"Blitter TOS" (or "Mega TOS", if you prefer)

Can anyone enlighten me as to where the moniker "1.09" came from?

AFAICR, none of the internal version numbers (AES, GEMDOS etc) in that TOS
version were 1.09, so it is unlikely to be a case of transposed version
numbers.

I seem to remember seeing this in an ST Format once, but it'll take me ages
to sift through all the feedback/STA columns. I think that it was just

another (wrong) number for a TOS version, or a TOS version that was never released.

It doesn't exist as v1.09 anyway, but apparantly some programmes had trouble detecting certain TOS versions...

I programmed with Laser C from about '87 to '94, then I bought a Pentium and only recently got any programmin tools- MS VC++ 5.0. Now I'm overwhelmed. So far, I'm just typing in some simple "C" stuff and seeing what happens, what sort of things are different at the elementary level- by elementary I mean non GUI stuff- and I now seem to have the hang of slapping together a simple DOS program.

But now I'm getting ready to tackle Windows programming. On my Atari I wrote several programs for myself that use primarily dialogue boxes with lots of buttons. I didn't really have a need for drop down menus. So I want to get up to speed quick in Windows, at least for dialogue boxes.

Is it going to be that much more difficult? Or easier? Any recomendations of good books?

I bought one book for Windows programming in the C++ language, but then of course I'll have to learn C++ first. I'd rather do the Windows programming in C and learn C++ later.

I'd love to have an expert Atari C programmer write a tutorial that would compare programming the Atari vs. the PC for Windows.

BTW, the ST computer isn't being made anymore is it? When was the last one made? Is there actually any serious programming still being done for the Atari? Is it still popular in Europe where I think more were sold.

Hye all !

I'm author of an HTML text editor called Joe (version 1.35). I need
the Word+ and RTF file format description to translate automatically
the DOC or RTF to HTML format when Joe is loading a text.

Thanks for the help.

You can download it at http://www.mygale.org/05/nef/

I'm also thinking (not working, I'm too busy these months) about
text generator modules for <BODY> and <TABLE>. Have you some
suggestions for another modules ? or for the program itself ?

Bye !

Rajah Lone / Queen Meka

Erm My 520 STFM that originally has a single sided floppy drive DID have TOS 1.09,

In fact I still have the ROMS but now my STFM has TOS 1.4 which i found in a 'dead'
STFM outside a PUB in Basildon Essex, TOS 1.09 is bug free in every way as far a general
usage and the mother of all incompatibilities STOS are concerned, Although no auto start
feature was annoying when I got TERADESK.

As far as I have found out over the years...

TOS 1.02 is often mentioned as TOS 1.2
TOS 1.04 (Was in another dead ST i found) is sometimes confused with TOS 1.4
TOS 1.4 is also called 'Rainbow TOS' as it has a multi coloured atari symbol in the desktop info bit.
TOS 1.6 in in STEs and the last STFMs(the ones that has blitters) is sometimes confused with TOS 1.62
TOS 1.62 is in 99% of all STes

Please correct me if i am wrong in any of this but it is what i have learned after doing atari stuff (not on www)
for the last 6/7 years.

i hear that TOS 2.06 supports 12Mb of RAM, is this true?

Yuck ! ;-)

I'd probably Pexec() the TTP, but having redirected (using Fforce()) the
stdout channel to some file or pipe. This way, the TTP causes no screen
output in the first place, while the output is kept in that file or pipe,
and you can display it in a window by your own (internal to your program)
means. This is even compatible with SingleTOS.

Cheers Peter

PS.: From your other message I deduce the result is intented to be a PGP

tool for NEWSie, and hopefully other E-mail clients. This is great
stuff. If you need more help, just let me know.

WHAT??????????
Lattice C at least is a commercial product. What you have done is completely ILLEGAL. I wonder where on the Internet you've got it.

Don't use pirated software.

Nope, they're the same thing (Rainbow TOS is actually called TOS 1.04)

>TOS 1.6 in in STEs and the last STFMs(the ones that has blitters) is sometimes confused with TOS 1.62

As fas as I know, TOS 1.6 was distributed in STEs only. It was designed to take advantage of the new hardware on an STE. I don't know if it can actually be used on an STFM? Besides, who would want to "upgrade" from 1.04 to 1.06?

  Yes, as TOS 1.4 is 1.04 as well. If I remember correctly, some bug caused some versions of TOS to be read this way... (somebody jump in here and explain this better!) ;-)

]-There was also an earlier version of TOS (disc-based as I remember) - TOS
]-1.0

  TOS was originally disk based, on the earliest ST's. Then the decision came to make it ROM based. TOS 1.0 wound up as a ROM OS as well...

]->TOS 1.04 (Was in another dead ST i found) is sometimes confused with TOS
]-1.4
]->TOS 1.4 is also called 'Rainbow TOS' as it has a multi coloured atari
]-symbol in the desktop info bit.
]-

]-
]-Nope, they're the same thing (Rainbow TOS is actually called TOS 1.04)

  Right, TOS 1.04, TOS 1.4, and Rainbow TOS are all the same thing.

]->TOS 1.6 in in STEs and the last STFMs(the ones that has blitters) is
]-sometimes confused with TOS 1.62

  Don't know why they would be confused, TOS 1.62 was a patch upgrade for
  1.6 to get rid of the medium res bug, AFAIR...

]-As fas as I know, TOS 1.6 was distributed in STEs only. It was designed to
]-take advantage of the new hardware on an STE. I don't know if it can
]-actually be used on an STFM? Besides, who would want to "upgrade" from 1.04
]-to 1.06?

  No, you can't use TOS 1.6 or 1.62 on an ST...(F or M) I tried, and the
  machine wouldn't even boot up...

]->TOS 1.62 is in 99% of all STes

  Not sure about that figure, but it was both TOS 1.60 and 1.62...

I didnt mean that STOS is bad because you have to use genfixer to get stuff to work on all
machines but it is one of it's few failings, I program in STOS too and have been luck with
the things that I have written for myself and my college mates but there is STOS stuff
about that never seem to work on either my STFM or My Falcon. STOS is an ideal programming
system if it wasn't i wouldn't use it,

:)

There are six known clones of Atari computers,
either announced or already in production. Check
out the list at http://www.tmisnet.com/~strads/hq/clones.html

Hey! inorton_badrul@hotmail.com (Ian Norton) wasn't it 3 Apr 1998
17:09:31 GMT that you wrote:

>I didnt mean that STOS is bad because you have to
>use genfixer to get stuff to work on all

bollox..what are you talking about ?.... STOS written programs run on
everything from a standard st..through ste, megas, falcons and even TT

NO FIXING REQUIRED!!!! its 1998 not 1987

>machines but it is one of it's few failings, I program in STOS too

Then get yourself the latest compiler and stop telling everyone that
STOS need fixing...or that stos has a failing.... the correct saying
may be that programs written with OLDER stos compilers need fixing and
stuff written with older stos and compilers have failings.... but
please dont just make sweeping statements giving the impression that
we are still in the dark ages :)

>about that never seem to work on either my STFM or My Falcon. STOS

Thats because its old stuff.. you never mentioned old stuff did you?

>is an ideal programming

eeerm I know :)

>system if it wasn't i wouldn't use it,

I would humbly suggest checking on things STOS before telling a
worldwide public newsgroup something...You make somehting now and it
dont need fixing for anyone..... hey I know my stos :))

.

Not ST, but compatible machines are still being built, and even completely
newly designed machines see the light of the day. This all is not by Atari
of course.

Cheers Peter

On 1 Apr 1998, Roland Prajoux wrote:

:
:One more opinion about negative subscripts.
:
: - A compiler has no way to know where a pointer points at, generally speaking.

It has, really! Try:

```
char array[42];char *p = array;

char foo(char *c){ *p;} /* returns first char of some array */

/* Now we can do:
*/
foo(array);
foo(p);

/* foo() will not know what kind of pointer it got
 * so that part of your argument is true
 * but if we try:
*/

++p; /* works */
++array; /* error */

/* Wow, the compiler actually knew that
 * an array is not a pointer :-)
*/
```

What then if foo() actually did something ?

```
char foo2(char *p2){--p2; return *p2;} /* returns previous char */
char foo3(char *p2){  return *(p2-1);} /* returns previous char */
```

```
char foo3(char *p3){  return  p2[-1];} /* returns previous char */
```

This might crash or return various amounts of junk depended on
what p2 actually points to. It is up to the programmer to stay
within limits :-(

Yes, but the "-1" is not involved here. You can do:

```
k=pointer[0];
```

.. and that should crash an atari as well. That area of

memory is protected (both of them)

I've had a bit of experience with RTF, having written
a WinHelp file in pure RTF (using NOTEPAD.EXE, much to
the extreme horror of the rest of the development team).
Development looked daunting, especially since RTF is a
word-processing standard, but the task went rather easy.

The RTF language is much richer than HTML 3.2, directly
supporting non-scrolling regions at the top of the display,
audio, and video -- this may cause conversion problems.

However! Your gut instinct that RTF lends itself to the
hypertext concept is accurate, and with a bit of effort ...
make that a lot of effort ... you would have a very
useful (even marketable) program on your hands!

Go for it! And if you'd like to search the net for the
RTF language definition instead of subsidizing Micro$oft
Publishing House, may I humbly suggest my list of search
engines at http://www.tmisnet.com/~strads/search/index.html .

I'm especially fond of the Meta Searchers, such as Ask Jeeves
and Debriefing. Either is a quick, fast way to search the net.

You used unsigned int bitfields in your structure example. I simply wondered if it was the same with those bitfields declared as signed int instead?

Mwc accepts both unsigned and signed for bitfields and the sign is taken into account. ie "int fred:1" when set to any non zero value returns a value of -1 whereas "uint fred:1" will return +1 when set to any non zero value. Although I almost always use "uint" myself I do have the impression that ANSI only allows "int". I could be wrong about this however. I just think I saw it somewhere.

>With 'normal' data types, I never found any similar inconsistency, So you
>can mix char, int and long mutually and with their unsigned counterparts;
>and what I've seen so far, an extra (unused) byte is inserted only when

Same with Mwc.

>I never looked at the situation involving float and double, since I
>rarely use them.

Ditto. I have no idea if alignment would take place in Mwc either. I could easily check but there's no point as we know each compiler uses its own floating point formats.

I don't think so. If you take into account the "Purist" design
philosophy applied to the 68000 (ie PC relative code is crippled
compared to the 6809) then that would explain why the above
instruction became a supervisor mode one - and would probably indicate
an oversight in the 68000 design rather than later cpu's. All imo of
course!

Simply enter superstate on the 68000 before the instruction and drop
back to userstate after and the problem is solved.

I have never used, and can never see, any reason to make use of either
of these two functions in user code. If people want to jump in and out
of functions then they should program in Basic! ;-)

>Different behaviour is observed from
>different compilers.

Indicating perhaps that there are serious problems which wouldn't
exist if the functions themselves did not.

>Pure C and Dec C (for Alpha) restore
>register variables into their original state (saving the
>processor status). GCC and MVC don't. Using volatiles
>solves that problem.

There's nothing wrong with having such functions. I'm sure the
compiler vendors make very good use of them. There is also nothing
wrong with documenting them so that folks can make use of them for
enhancing their compilers but they should be left documented as
"internal" and left at that.

After all, the same effect can be obtained simply by linking in a
function written in assembler.

>> In effect I'd be happy to code this ...

>    add.w   d0,d0
>    move.w  d0,(a0)
>Which makes no sense.
```

But it does. What if the reference to the address stored in a0 has a side effect like clearing some hardware status when written to? Your first bit of assembler clears this twice whereas the second bit only does it the once.

Similarly with reading - what if two items are mapped onto the same hardware address and it toggles between them. The first time you read it, it could be fred, the next time it could be some status value.

>Our are you troubled with fred changing between
>the two readouts?

It is certainly a concern although the above reason is more important.

```
>Then you will have to make the
>operation atomic, with functions like
>enter_critical_section();
>*fred=*fred+*fred;
>leave_critical_section();
```

Which at best makes volatile totally redundant (you might as well replace enter/leave_critical_section and *fred=*fred+*fred with process_fred()) and at worst has no different effect than that of the assembly above - ie possibly undefined.

Hmm, I may have misunderstood. I assumed when you mentioned VT52 that
you were referring to the MagiC VT52 window in which case the above
would work - the text would appear in the vt52 application window, and

your process would carry on working in parallel but here it would
simply wait for the CH_EXIT message which MagiC sends your process
when the "child parallel process" terminates.

>This than causes

Yes, the normal shel_write can only "chain" programs. If I have
misunderstood then you should use Pexec() and redirect the output as
Peter suggests.

>slapping together a simple DOS program.
>
>But now I'm getting ready to tackle Windows programming.

I've written one Windoze program atm. It is a port of an Atari program I wrote which is itself a Gem rewrite of the SPLITTER program. I don't know very much but as nobody else has replied yet I'll dive in with my tuppence worth ... ;-)

>On my Atari I
>wrote several programs for myself that use primarily dialogue boxes with
>lots of buttons.

Modern Atari programs are now expected to work within a window so that the multitasking operating systems now available will not "block".

>I didn't really have a need for drop down menus. So I
>want to get up to speed quick in Windows, at least for dialogue boxes.

I've only ever tried MVC 3 and thought it was a dog so went out and bought C++ Builder (BCB). I hope later versions of MVC are better. I could well be wrong but I don't think there is any Windoze equivilent of dialogue boxes. From what I've seen it all goes in a window - the nearest you get to a dialog box is to tell windoze to display the window modally.

>Is it going to be that much more difficult?

There's a lot code involved to make an Atari program run a dialog box in a window. It is not hard but long winded and thus subject to silly errors. From what (little) I bothered to look at in MVC3 it gave the impression of being at much the same level.

>Or easier?

Should be much easier on the PC. You should take a good look at the MFC library. Although BCB has it, I use Borland's own thing called the VCL (Visual Component Library). If they bear any resemblence to each other then the class library route is by far the best to take.

>Any
>recomendations of good books?

C++ for Dummies.

>I bought one book for Windows programming in the C++ language, but then
>of course I'll have to learn C++ first. I'd rather do the Windows
>programming in C and learn C++ later.

That's what I thought. I was wrong. Learn at least enough C++ to make use of the class libraries. You can write the rest of your stuff in C if you want. Here's why (but I'll have to talk about BCB) ...

It revolves around a resource editor. You drag visual components onto the forms (ie windows) you create. This is nothing more complex than designing how each window looks. Each element on the form has properties which you set much the same as an atari resource editor.

There the similarities stop:

Each visual component also has the ability to react to events or actions which might occur upon it and these are listed for each component. You simply click on the events you want that component to be able to handle - up pops the editor with the function template already written for you and you just type in some code for it.

Consider this. I have dragged my logo onto the main window, named it and want it to respond by opening another window when it is clicked upon. I click on the "single left mouse click" event and BCB generates this ...

```
void __fastcall TForm1::F0SwampDogClick(TObject *Sender)
{
}
```

... into which I type

```
 Form2->Show();
```

... because I want to open and display the "about this program" form. ie the whole thing is:

```
void __fastcall TForm1::F0SwampDogClick(TObject *Sender)
{
 Form2->Show();
}
```

Compare this with having to do it manually - waiting for a mouse click, finding which object it is over, constructing a window, positioning it, creating a handle, opening it, drawing (and redrawing) the contents, waiting for the window close message, closing it, deleting it and dealing with all the associated errors that can occur along the way - not to mention the zillion other messages flying around the system as well.

>I'd love to have an expert Atari C programmer write a tutorial that
>would compare programming the Atari vs. the PC for Windows.

I doubt this would ever happen. There is only one C++ compiler and it requires too much space for a lot of people to use. Additionally, folks have written different libraries which add all sorts of things to Gem, and Gem can be programmed in many languages. I still program Gem with a K&R C compiler!

>BTW, the ST computer isn't being made anymore is it?

Nope, but clones are and very much faster than the ST. Basically the situation is more geared toward machines compatible with the Atari operating system (or equivilents thereof). Thus you'll not only find dedicated "Tos" machines such as the Falcon, Hades etc, but also on the Mac (MagicMac), PC (MagicPC, PacifiST, TosWin) and even unix

(STonX).

>When was the last
>one made?

The clones still are.

>Is there actually any serious programming still being done for
>the Atari?

Very much so.

>Is it still popular in Europe where I think more were sold.

Yes.

Lattice C is still being sold so you shouldn't have been able to get
it off the internet. I assume you didn't know this or you wouldn't

have posted here.

You'll have to purchase a new or second hand copy (5.6 is the latest
iirc) for two reasons aside from the above:

1) You don't know it is all there or installed properly.
2) A compiler is useless without its manuals.

>I need to make a
>program using Dialog Boxes, Menus, and all that GEM stuff. Can any one help

This will be explained in the manuals. ;-)

OK, I need some helps, recently I have encountered an AES-Message sent to
FireNews (when I had installed Stewart (unregistered)) and I cannot find
anything that tells me what this message is....
The Message is 0x4d8f nad it is sent to FireNews after the Evaluation period
of 30 minutes (in Stewart) has gone.. ie after Stewart has turned itself off
(it is still active in memory though) IF I delete Stewart from memory this
message is not sent, so I guess it is Stewart that sends it to me..

Can anyone help me and tell me wht this message is, and what it does?

I know. That was what I felt about it, but it was the only way I could think of that would ensure no updates while PGP was working, and that would make sure that windows would be redrawn, clearing up PGPs output.

> I'd probably Pexec() the TTP, but having redirected (using Fforce()) the

The trouble with using Fforce() would be knowing when to input the password or phrase and, more importantly, re-enter it if it was misstyped. Apart from that, it would be the best idea.

There is a way of setting the password as an environment variable, but that then means it would be available to anyone who decided to have a good look. This then causes a security risk, as far as I'm concerned, and would be unacceptable.

That is the idea. It was a stop-gap measure since John was/is looking at
including PGP support directly. Any E-mail client that calls an external
editor would work with it.

At the moment I'm having to get it back to it's fully (or almost) debugged
position. I lost (sort of) the final version when my EZ-drive died. I'm
just lucky I had an earlier copy of the source on a floppy, so I don't have
to do a full re-write. Sort of taught me to keep a back-up.

Hi Folks,
I'm going to try to learn to program in Lattice C, purely for my own interest I
guess, but partly because I'm getting annoyed at how no modern synths have Atari
editors. What I want to do is program not editors themselves, but an editor
creator. Does this sound sane? If not, why not?.....maion problem is, apart from
a really basic Basic course at college ten years ago I haven't programmed
anything other than a TI58-C calculator at school (fifteen years ago)....are
there any books, example source-code for MIDI handling, tech-yourself guides
etc,

Mnay thanks for all help given

chrisc

That is what i would like to do, use the VT52 window I mean, but doing that excedes my knowledge ATM. I've been given a suggestion of using AV_START to do this, and maybe that would be the way to go. The thing is, I still can't see how I'd be able to pass the command-line to PGP.TTP, going through VT52. Once I can, it should be a small(ish) change to use VT52. Then all I've got to do is check if Magic is in use.

> Peter suggests.

The trouble is, I can't redirect the output. If I do and there's a typing error when entering the pass phrase/word, the user wouldn't know unless they tried again after 5 mins of nothing happening.

I'm looking at another method of passing the pass phrase/word via the command-line, and if it works, I can possibly remove PGPs display. That is, if the +force option and/or +verbose=0, turn off the output. I'll have to do a bit more checking, but that could be another way to go. I'm not too happy, since I'd then need to add another line to the dialog for the pass phrase/word to be entered into, and since I'm using form_do(), I can't hide it from view.

Greatings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site and download it from there.

www.users.globalnet.co.uk/~mega01/

Issue 2 is on 2 discs and has over 200 articles covering just about everything we can think of. There should be something there for everyone.

If you would liked to be mailed issue 2 then send you E-mail address and request it. I will then Mail it to you. Or you can wait until it is uploaded onto my site.

Mail me at. mega01@globalnet.co.uk   Now for issue 2.

Chris Swinson.

Trying to tramsfer my Atari-txt-files to a PC for laser printout I lost
several characters.

My ATARI is an MEGA STE 4 with french keyboard, the PC has French/swiss
keyboard. The changed characters are special french characters only like
they are replaced by other ones.

Hope that somebody has an idea how to get the right characters or to
transcript the atari txt files.

Thanks

It's absolutely stupid IMHO. Sure writing to SR must be priviledged, but
what the heck, no application can do any harm by reading SR. What do you
do in a situation where you don't know if you run in Super mode oder
User mode ? Calling Supexec() wastes a lot of time if already in Super
mode, and also cannot be used in all circumstances. Also, it's stupid,
if all you wanted to find out is if you run in Super mode ...

Cheers Peter

IIRC this is not according to the C standard. IMHO it also does not make
any sense. A bit is unsigned by definition; a signed one would mean the
one bit is taken as the sign, and zero bits for the absolute. That's silly
isn't it ?

I don't quite know about ANSI C though.

> Mwc accepts both unsigned and signed for bitfields and the sign is
> taken into account. ie "int fred:1" when set to any non zero value

The compiler should not accept this, as a bitfield is not an "int". Note
a bitfield is declared by

```
   unsigned  fred : 1
```

and not

```
   unsigned int  fred : 1
```

> have the impression that ANSI only allows "int". I could be wrong

ANSI must allow unsigned, as that was the original version also described in
K&R. However I don't really know about signed.

I would just ignore it. That's the proper reaction anyway. With newer
software, you may receive more unknown AES messages. If you don't know
them, ignore them.

On 2 Apr 1998 20:44:51 GMT, for some strange reason Ian Norton
(inorton_badrul@hotmail.com) wrote this...

> TOS 1.02 is often mentioned as TOS 1.2
> TOS 1.04 (Was in another dead ST i found) is sometimes confused with TOS 1.4

aren't they the same ???

> TOS 1.4 is also called 'Rainbow TOS' as it has a multi coloured atari symbol in
the desktop info bit.
> TOS 1.6 in in STEs and the last STFMs(the ones that has blitters) is sometimes
confused with TOS 1.62

I always understood that 1.6 didn't work in STFMs (did any STFMs really have blitters ?), because it was STE only, you know the DMA sound, blitter, and hardware scrolling stuff.

> TOS 1.62 is in 99% of all STes

So where does this 1.09 fit ?

>
> Please correct me if i am wrong in any of this but it is what i have learned after doing atari stuff (not on www)
> for the last 6/7 years.

According the

"Little Guide to TOS Revisions, version 1.0" written by John Townsend from Atari Corporation, there are:

ROM TOS (1.00)
MEGA TOS (1.02) with blitter support
RAINBOW TOS (1.04) blitter, GEM autorun, foldrxxx patch.
STE TOS (1.06) supports STE hardware
STE TOS rev 2 (1.62) fixes bugs in the above.
Mega STE TOS (2.05)

This text file ends here as far as ST TOSses go.

Note that there is no mention of TOS 1.09. I suspect that some test programs did not interpret correctly the TOS rev number, thus the confusion.

This document is available at
ftp://ftp.cs.tu-berlin.de/pub/atari/Doc/tosguide.lzh

>
> i hear that TOS 2.06 supports 12Mb of RAM, is this true?
>

I think it's 14Mb, but only if the MMU is able to address that much memory, which doesn't seem to be the case on any ST/STE machines.

Sorry, I thought it was not in the stores yet; at least in my country it is not. By the way, I am making charity with the old Atari STe making any program for it; you should be glad to see that someone still code for it (I always can use my brilliant new -and original- Visual C++ 5.0)

Thanks for nothing, Josephus.

P.D.: I will delete the Lattice C file.

> illegal. Again, I know we all use it but that isn't the issue.

I am very sure that a negative subscript is not illegal. Accessing memory outside arrayboundaries is however. I am not sure how these rules apply to structures. The best course in these situations is to play it save if you want to be portable. Jens M Andreasen <jens-and@dsv.su.se> has found a good and 100% portable solution.

> I don't have the book so I hope you've got it right. I'm only going on
> what you said are the rules!

If you can get a copy of the book do it! I think it's one of the best books about C.

> I'm not saying you are wrong. It's simply that I see more
> disadvantages to them being volatile than not.

I never have seen a C compiler that treats structures as nonvolatile. Even the very optimizing DEC Alpha C compilers do. And on Alpha's the are lot's of registers to hold structures. But then again, this says nothing about it being illegal.

Bye, Hans

I wasn't trying to get it to work. I was testing the compiler.

(Normally I just use a char array and cast the first byte as unsigned when I read it.)

-----BEGIN PGP SIGNED MESSAGE-----

Lets start at the beginning. I've written a PGP interface, sign and encrypt only, for NEWSie. The problem is PGP writes to the screen as a TOS program, and under a multitasking settup this corrupts the desktop. To get round this, I want to use VT52 to redirect the output to a window, while passing the command-line to PGP. The only trouble is VT52 takes the command-line as its own and displays a dialog to enter the command-line for PGP.

The question is how do I call a TTP, using VT52 to redirect the output to a window, without typing in the command-line at the dialog? At the moment I'm opening a window that covers the entire desktop, and using wind_update() to freeze screen output, just before PGP is called, and closing it after PGP quits. While this works to an extent, forcing all the windows open to be redrawn, I'd like to use VT52 if possible.

Thanks in advance,

That's a neat way round it. :-)

The real question is though - is the use of a negative array subscript
technically legal or not?

<still off topic>

There were a couple iirc. One was awful but the other seemed to do
Basic reasonably enough.

Just an update on my Toolbox DLL engine:

Since my last post regarding my DLL-like engine for the ST family, I've been busy ironing out the few bugs that surfaced shortly after I announced it in c.s.a.p

It still requires a 68000 (or better) based computer.

The TRAP based interface is now leaner, faster and more reliable. (The direct-call interface [ie not via the TRAP interface] is still there)

It now consumes slightly less RAM.

It now supports two types of loadables - system and user libraries. System libs are intended to extend the system (ie 3D interface elements on older TOS versions, joystick control etc) or patch holes in it. User libs are intended to be modules within software or system-wide utilities (graphics converters, archivers) that can be called by the foreground apps.

I've started work on a user and a programmer manual.

The header files are designed for Lattice C using 32-bit integers, but should be easily modifiable for systems with 16-bit integers..

(My ISP has been having problems with its news server over the last few weeks, and has switched from its local Auckland NNTP server to its Wellington based one [650 kilometres/400 miles away]. It appears to be working OK now)

:The real question is though - is the use of a negative array subscript
:technically legal or not?
:
:
:--
:guy@swampdog.demon.co.uk
:http://www.swampdog.demon.co.uk

Negative arraysubscripts are not legal, but then again, where does the
array start?

```
char array[42]
char *p= array+1;

p[-1]; /* Welldefined and legal  */
p[-2]; /* Braindead, illegal, might crash */

++p;

p[-2] /* Yes, legal, points to *array (array[0]) */
```

It is not p that is the object, it is "array[]", so we must stay
within the limits of "array[]".

It should be pointed out that Pure C does a similar thing in an inconsistent way. I consider it a bug in the code that handles bit arrays, although strictly speaking (i.e. the C definition) it's not. Define a structure

```
struct {
   unsigned test1 : 4;
   unsigned test2 : 4;
   unsigned test3 : 8;
 } sample1;
```

and you'll find that sizeof(sample1) is 2, while sizeof(sample2) with

```
struct {
   unsigned test1 : 5;
   unsigned test2 : 3;
   unsigned test3 : 8;
 } sample2;
```

yields 3, because Pure C puts each part in it's own byte here. This 'feature' makes Pure C's bit arrays useless if you got to match some externally defined structures (I had that trouble with various network protocol header definitions).

Cheers Peter

Haven't you ever wanted a new GEM command to

make programming easier, such as evnt_joypad(),
or evnt_mediach() ? How about a built-in ximg
compression/decompression command?

If so ... send your suggestion to Wizztronics!
They're developing an Atari Clone computer, and
they've asked for public input to make it better.

I've been having fun sending suggested AES calls
I'd like to see (that's them up in the first
paragraph), knowing they'd make application programming
much easier and productive for me.

Visit their web site at http://www.wizztronics.com
to see what's going on, then email your suggestions
to toscompinfo@wizztronics.com going into as much
details as you see fit.

If you've ever wanted to influence the development of
a "new and improved" computer, nows your chance!

Did you test with multiple games? I've found that some games emulate faster than others. For example, Space Invaders runs about the fastest and usually plays on the slowest PC's and Macs. Another game that doesn't require too much overhead is Asteroids. Basically, many of the old original arcade classics (B&W w/ simple graphics) will run smoothly on older machines...

I've just bought an IDEal interface and drive from TUS which gives me an internal IDE drive in my STE. Unfortunately I've only got TOS 1.62 which means that I can't boot from an IDE drive directly.

This means that I have to load a driver from a floppy, which then recognises the drive, and gets GEM to load acc's and desktop.inf from the IDE drive.

Only one problem, I can't load AUTO folder programs from the C drive, only desk acc's. Would it be possible to simply write a program to execute all programs from the auto folder on C:\ ??

Does TOS actually change into the AUTO folder before executing the programs or does it just run them with the currect directory being the root of C ??

Would the following work?

```
change into c:\auto\
loop
  execute next auto program
until no more programs
change back to c:\
```

Cheers

Phil

I tried Centipede and the very old Z80 CPU game Circus. If Circus couldn't
be emulated fast enough to be playable, I don't know what could!

Way back in the distant past I remember there being a program called,
believe it or not, CAUTO which did the job you want. I can't, for the
life of me, remember which application it came with.

Perhaps someone else, whose neurones are not so rusty, can help out on
this.

ATM, there are no public releases of the Toolbox DLL engine.

(Earlier Toolbox releases exist, but aren't extensible or fully compatible with the DLL spec I invented)

I was almost ready to do a public release of v1.24, but just at the last moment I spotted a glitch, and spent most of the weekend fixing and testing it. (I prefer to delay a release to kill bugs, than release with seventeen patches shortly thereafter)

I should be able to release it shortly. (The manual still needs to be written beyond the introductory phases - unless I over-comment the example source files in the archive and leave you to deduce how to use it until the manuals are completed, but this approach seems a bit less than desirable)

Sorry for the delay.

I think CAUTO was part of the TOS 4.92 archive (tos492.lzh). If I remember correctly, it was included so that Falcon owners could boot TOS 4.92 from floppy and then carry on running their normall AUTO folder programs from drive C:

Still, why not release the sources for the Atari port? It would allow
others to take a look at it and surely a Hades or maybe even a Falcon with
a AB040 would be able to play something.

I found the program you mentioned in hensa (now at cyberstrider).

Cheers to anyone who helped!!

Mostly because I don't have the time to get them into shape that would be
of any use to you :-) I tend to code first and add comments later. Still,
I'll see if I can dig them out at some point, after I get the taxes done
(Blah!)

I booted up my compiler and tested the call ... the
Compendium was wrong and the posters were right!

It really IS clicks that should be or'd with 0x0100
and not mask.

Thanks, everyone, for your indulgence.

Wherever we decide at the time of processing it! :-)

```
>char array[42]
>char *p= array+1;
>
>p[-1]; /* Welldefined and legal  */
```

Don't you mean "technically illegal" (negative subscript) but in

practice legal enough to expect any C compiler to do what we expect -
then I totally agree, I use negative subscripts regularly myself and
would be very upset to find a compiler it failed on!

```
>p[-2]; /* Braindead, illegal, might crash */
>

>
>p[-2] /* Yes, legal, points to *array (array[0]) */
>
```
>It is not p that is the object, it is "array[]", so we must stay
>within the limits of "array[]".

This is one of the main reasons I think C is such a good language. It
allows us to go with the mental concept rather than being forced to
stick with the original definition.

>
>I am very sure that a negative subscript is not illegal.

I'm not so sure as 'C' arrays always start at zero. As I've probably
said before though (<G>), I regularly use negative subscripts myself
as I consider it "more readable" than a pointer+offset in some cases.

>Accessing
>memory outside arrayboundaries is however.

Yeah, again a grey area. For all intents and purposes, the boundaries
of an array (or anything for that matter) are what we mentally
consider them to be at the time of manipulating them (machine
limitations aside). I mention this only because it is (possibly) my
personal favorite reason for liking C so much. :-)

>I am not sure how these

><jens-and@dsv.su.se> has found a good and 100% portable solution.

Yes, it was rather good wasn't it. Another reason for liking C -
there's usually a solution to anything!

Ah. I used to live in a shared flat and one of the things on the
bookshelf was the K&R book. I've read it many times but that was years
ago so buying my own copy of it always takes second place to something
new. You're right though, I ought to get it.

I've been wondering if all of us are talking the same thing when we
say "volatile". I understand it to mean the compiler must, at each

reference to the volatile, reload it from its storage (or behave as
though it has).

One of the options to MagiC's shel_write() is "isgr" (or "isgem")
which tells the system if the child process is a gem program or a tos
one. Set this to the correct value (zero or one) and you'll find the
vt52 window is invoked automatically just like you want.

As for the arguments, change the extender to "prg". This will stop the system prompting with a dialog box for them. It is then a simple matter to pass them directly to shel_write().

If I've not been clear I think can dig out some C code with a bit of luck - Sduu used to work like this before I integrated the encoder into the program itself.

Nope, not very clever is it!

Yeah, it does look like a bug - I wonder how it comes about. Does it
behave the same with signed integers?

Of course, neither does it help with Lattice aligning its bits the
other way round. Causes me no end of mental alignment problems with
the Compendium :-)

>root of C ??

The latter. This why most "auto" program datafiles end up in the root.

>Would the following work?
>
>change into c:\auto\
>loop
> execute next auto program

>change back to c:\

Nearly. A minor modification and some C-like pseudocode ...

```
Dsetdrv('C:')
Dsetpath("\\");
if (Fsfirst("\\AUTO\\*.PRG) == E_OK)  {
     do   {
          s = Dgetdrv() + ":\\AUTO\\" + progname;
          Pexec(0,progname,emptycmdline,NULL);
     }while (FsNext() == E_OK);
}
```

... leaves us in the root while the auto folder programs run and
executes them in the same order as would Tos.

I'm not completely sure about "emptycmdline" and the NULL environment
pointer except I cant see any reason why Tos would be passing a
command line and the only sensible thing to do with the environment is
inherit the current one!

Already been done :-)) Look for an accessory called "Autoloader" which once
loaded continues to load and run programs in turn from a list.

It claims to be (C) Brutel Solutions 1991 but I'm fairly sure it came either
from a cover disk or PD library.

I hope you send your suggestion in to Wizztronics.
Given the chance to ask for the OS changes of your
dreams, I would think there'd be a lot of chatter
here in c.s.a.programmer about the most worthwhile
manner of implementing the desired changes.

Oh, well. Maybe it's all happening in secret.

One more opinion about negative subscripts.

 - A compiler has no way to know where a pointer points at, generally speaking.
Then, pointer[-1] should be legal.

 - Conversely, if a symbol relates to a fixed (identified) area in memory,
then symbol[-1] should be illegal.

I precise.
If one defines:

```
    char *pointer ;
    char symbol[64] ;
```

then:

```
    - 'pointer' is a variable and pointer[-1] should be legal,
    - 'symbol' is a constant and symbol[-1] should be illegal.
```

Cheers.

It can still be undefined in the standard's sense. This is independent on
whether this is provable or not (and it is very often unprovable).

Well, that is on non memory protected machines like the ST. On Unix
it is a complete other story. I am not sure whether is wil see
accessing memory outside an array but inside a struct, but
lot of other cases will be catched.

Be sure you get K&R2, the one about ANSI C.

And put it back in storage after the variable is modified. It's
very usefull vor variables that are changed by interrupt routines.

Pointer[-1] could be legal, dependend where is is pointing to. If
it is inside an char array it is legal. Otherwise teh result is
undefined.
Example:
```
{
  char* pointer=(char*)0;
```

```
  char k;
  k=pointer[-1]; /* this will cause bombs on an ST */
}
```

It looks like a bug, it might be a bug in the compiler, but
it is perfectly legal according to the C standard.

There is nothing compatible on bitfields. It should be only
for internal use. They are completely implementation dependent.

Q: To use the AV_SENDKEY message to send a keystroke to the AV Server, must a client first issue the AV_PROTOKOLL (and later the AV_EXIT) message?

I am sending the AV_SENDKEY to the Application name returned by:

```
     env = getenv( AVSERVER );
     aes_id = appl_find ( env );
     if (aes_id==-1) { /* no server */ return; }

     buffer[0] = AV_SENDKEY;
     buffer[x] = etc.
     appl_write( aes_id, 16, buffer );
```

But nothing seems to happen on the desktop, etc. if I pass say a ctl-o (Open).

Ideas?
John

Yes, of course.
Even *pointer, although legal, can be undefined!

Sticking to my example, my point was that one can be sure that symbol[-1] is
undefined, while there is no such certitude for pointer[-1].

How do you mean ?

With 'normal' data types, I never found any similar inconsistency, So you can mix char, int and long mutually and with their unsigned counterparts; and what I've seen so far, an extra (unused) byte is inserted only when a 16 or 32 bit type follows a char that's at an even address. I never looked at the situation involving float and double, since I rarely use them.

Cheers Peter

OK, here's a sollution for you..

since I've jsut introduced this into FireNews and Babel I know that you do not have to tell the AV-Server that you know the AV-Protokoll. However you must search for the correct name...
Lets asume this, you have Thing for AV-Server

your shel_env command will give you this back "THING" (unless ofcourse you specified some other AVSERVER or have not specified it at all)

The problem then is that the appl_find call expects an 8-char long string to find the app-id... but what you send in is not an 8-char long string.... it's a 5 char long string... What you need to do is to add spaces to the end of that string so that the string is 8 chars long..
ie "THING" will become "THING   "

Then it should work...

Hi Tim,

  langen@rx-online.de.:
 > Does anyone know where I can get a free
 > BASIC or C Compiler for Atari ST .

I know of no free BASIC compiler, but in the C stakes there are a few:

Sozobon C,
Heat and Serve C, (a later version of Sozobon)
GNU C and
GNU C++

GNU C++ only works on machines with larger memories (4Meg at least), all
the
others should be okay with 1Meg. They should all be available from any
Atari
archive.

John.

The trouble is I need to call vt52 as a child of my program and AFAIK using
shel_write() would make it wait until my program has quit. This than causes
a problem since I have to separate the message from the header before
editing so PGP only signs/encrypts the message, and not the header. Once
PGP has finished, the signed/encrypted output is then added to the end of

the messager header and the resulting file is what Newsie uses as its temp.

Why not? I guess there are some boot selectors doing it this way. Also MiNT
can be configured to start programs when booting ("exec ...").

>Does TOS actually change into the AUTO folder before executing the
>programs or does it just run them with the currect directory being the
>root of C ??
The current directory on startup is the root dir of the boot drive ("C:\" or
something similar).

>Would the following work?
>
>change into c:\auto\
>loop
> execute next auto program
>until no more programs
>change back to c:\
Should work with most progs, but there are some which look for config files
on the boot drive instead of the actual drive. You can either put these
files onto the boot diskette or write a short piece of code to change the

"official" boot drive to C: (AFAIR it is a sysvar?)

Hope that helps,
     Lars

Basically, whatever speedo and NVDI do now is what you would have to
do in FVDI. Any programmer wanting to use loadable fonts does it
transparently now, i.e he doesn't have to provide a memory buffer or
cache for those fonts. Speedo/NVDI takes care of all that for all
programs. The vst_loadfonts lets you know what fonts are available
and lets NVDI know your workstation is using them. When you "unload
the fonts" no memory is returned to the system although NVDI may
flush its cache. The names of the routines apply more to their
original use under the first GDOS. Of course, there was no
multitasking then.

The book 'Atari St machine code' from Roger Pearson helped me getting started on the Atari range of computers. It's a good book if you already know the basics of asm.

Cheers,
Eabe

Hi, Kenneth.

There is currently no documented way to do this. It is a problem that I
am aware of, and several solutions have been discussed. For now, I would
reckomend including multiple trees, so you can use one tree pr. window.
This is a less than ideal solution, but it is safe, quick, and
painless...

: I'm trying to do some 3D stuff, and I'm wondering about projection.
:
: Imagine I've 3D cordinates (X,Y,Z).
: After rotations, I obtain (X',Y',Z')
:
: What is the fastest method (no need of code, I'm talking about method) for
: projecting (X' Y' Z') for having 2D coordinates (Xp,Yp). ???
:
: I'm using something like:
:
: zoom=a+b/z
:
: xp=cx+zoom*X'
: yp=cy+zoom*Y'
:
: where a and b are constants that defines the projection plane/depth
: and cx,cy are the coordinates of the centre of the screen.

What EXACTLY do you mean by a and b ?

: Is it possible to do that without multiplications and/or divistion, even if
: it reduces the precision ? Perhaps by using tables ? But I'm a little bit
: short in memory, so it must be as little as possible.

There are two generally used methods to do projection :

1) Parallel projection : This is rather lame, but sometimes used for
   technical draw. Hardly any method : just drop the Z component. In
   your case : x := cx + X'

```
                y := cy + Y'

    I believe this is not the type of projection you're looking for though.

 2) Perspective projection : This is what you are doing :

    x := cx + X'/Z'
    y := cy + Y'/Z'

    Several ways to eliminate the number of 'projectible' points exist :

    * trivial one : discard all points with Z' < 1.00, where z is
                    assumed to be zero in the eye-point and 1 on
                    the projection plane. This technique is called
                    front-plane clipping ( I think). The underlying idea is
                    that points lying 'in' or behind your eye are discarded.

    * back-plane clipping : identical to supra, but when Z' exceeds
                            a given treshold value. The idea here is that
                            points beyond a given distance become
                            'invisible'.

 Now, table methods are fine, but they HOG memory, certainly in this case,
 where you'll need an entry for every possible (x,y,z) tuple. Their size
 automatically depends on the range of your x/y/z components. But by
 using tables, you could speed up your transformations since those can be
 incorporated in the tables too (but transforming the table data my
 prove to make things even slower...)

 BTW, what do you need it for ? There exist several rendering techniques
 WITHOUT perspective projections.

 Any time,

This is the syntax for the AES evnt_button() call:

evnt_button(clicks, mask, state, mx, my, button, kstate)

Does anyone know how to set the mask and state parameters in order to get
the system to wait for either a left or a right mouse click? I can get it
to wait for just the left button, just the right button, or both. But I
can not get it to wait for either.

Thanks

Thomas Sahlin

Hi there,

I used to do some stuf in assembly on the ST. But since I've got my 030 i switched to C. It is much better to use when you are creating larger programmes.
The package I use is pure C 1.1 from ASH. It also contains an assembler. The debugger can also work on assembly level. And the whole package commes with a 'real' paper manual of 450 pages. If you want to do some special stuf that has to be in assembly it is quite easy to cal an assembly routine from C.

A great book on assembly on the 68000 is 'Introducing ATARI ST machine code' by R.Pearson & S.Hodgson from zzSoft. There is a disk with this book that contains an assembler and debugger. It also works on a Falcon, but the editor and debugger only work in High res ST compatible mode. (ISBN 1 873423 01 2)

I don't know the exact differences between a 68000 and a 68030. The latest probably has more op-codes and is faster because it has a 32 bit data bus instead

of a 16 bit, so it can read or write a longword in one cycle instead of two.

regards, Arjan

I'm sorry, I (wrongly) assumed as it existed in stdio.h of both of
the compilers
that I have easily to hand (DJGPP and BC4.5) that it was part of STDLib. It is
not mapped to anything in either GCC or Lattice on the Atari, however I note
that it is defined in Prospero C's stdio.h.

BC's help does mention that it is not part of the unix stdlib in the
help files (what is it doing in stdio.h then?? surely it should be
somewhere else?).

Ok, I had the same problem some time ago, and found this text in one of issue of ICTARI (don't remember which). I'm posting the whole text, as this is very important info :)) I hope the ICTAR ppl don't mind...check that magacine out, btw. It's a ST magazine for programmers...

http://www.elis.demon.co.uk/ictari/ictari.htm ICTARI -The ATARI programmer's user group

Ok, here it is....

Using the right mouse button with evnt_multi in Assembler
==========

You will probably have noticed that very few applications for the Atari make much use of the right mouse button. The reason given was that

there was no simple way for a GEM program to do it. It turns out that there has been a legal way to do it all along - Atari finally got around to documenting it a couple of years ago, but only to registered developers.

The evnt_multi AES call can be programmed to recognise either the left OR right button click by setting the clicks parameter to 256+1 and the mask parameter to 3. For example using the HiSoft MACRO call :-

```
evnt_multi     #flags,#clicks,#mask,#bstate,#m1flags,etc,etc
```

In the 'flags' parameter, bit 1 should be set so that mouse button events will be recognised as well as any other bits required.

'clicks' should be set to 1 or 2 to recognise one or two clicks as normal and bit 8 also set to detect the right button event. It is recommended that the parameter is written as #256+1 or #256+2 so that it is obvious what conditions are being monitored.

The 'mask' parameter should be set to 3 so that left and right buttons are recognised.

The 'bstate' parameter should be set to 0 to recognise 'mouse down' events.

The remaining parameters are set as normal depending on which facilities are required.

On return from evnt_multi the program should examine the int_out+6 store to determine which button was actually pressed, i.e. left button = 1 and right button = 2.

See C\EVNT_BUT\EVNT_BUT.TXT file on this disk for further information on the history of this function.
